

KIDS!
COUNT
in Colorado **2018**

25 Years of Ensuring Every Kid Counts

COLORADO CHILDREN'S CAMPAIGN

is made possible through the support of:

THE ANNIE E. CASEY FOUNDATION

This research was funded in part by the Annie E. Casey Foundation. We thank them for their support but acknowledge that the findings and conclusions presented in this report are those of the authors alone, and do not necessarily reflect the opinions of the Foundation.

We also acknowledge the generous support of the countless contributors whose investments make possible the work of the Colorado Children's Campaign, including sharing this critical data throughout the year.

This 25th anniversary edition of *KIDS COUNT in Colorado!* is dedicated to past and current directors of the KIDS COUNT project at the Colorado Children's Campaign.

Each edition of KIDS COUNT is truly a team effort with many staff members involved in research, writing, editing, design and presentation. Yet the report wouldn't be possible each year without the leadership of a KIDS COUNT director.

As we celebrate the 25th anniversary of *KIDS COUNT in Colorado!*, we're honored to recognize these project directors for their talents, expertise and vision. Thank you for 25 years of ensuring every kid counts!

1993-1994: Beverly R. Buck

2001-2006: Kaye (Boeke) Kavanaugh

1995-1997: Shanna Shulman

2007: Aimee Williamson

1998-1999: Christine Staberg

2008-2012: Lisa Piscopo

2000: Jenifer Vasquez

2013-2018: Sarah Hughes

2018 KIDS COUNT IN COLORADO!

25 Years of Ensuring Every Kid Counts

KIDS COUNT in Colorado! is an annual publication of the Colorado Children’s Campaign that provides the best available state- and county-level data to measure and track the education, health and general well-being of our children. The report informs policy debates and community discussions, serving as a valuable resource for policymakers, community leaders, advocates and citizens.

The **KIDS COUNT in Colorado!** project is directed by Sarah Hughes, Vice President, Research Initiatives. Design by Rob Sherow, Design Manager.

Permission to copy is granted so long as **KIDS COUNT in Colorado!** and the Colorado Children’s Campaign are cited as the source.

LETTER FROM THE GOVERNOR

John W. Hickenlooper
Governor

March 22, 2018

Throughout my eight years in office, my team has had many opportunities to work with the Colorado Children's Campaign as we craft policies to support children and families. The reliable research and data on children found in the annual *KIDS COUNT in Colorado!* report has been essential in many wins for kids over the years.

Each year, this report brings us the most recent information on child well-being so we can track what is working—and what work needs to be done. A few successes you'll see this year include:

- We've moved more kids enrolled in CCCAP into high-quality programs so parents can work and kids can get the early development they need to succeed.
- Our innovative education policies are supporting students and pushing graduation rates to reach nearly 80 percent—and graduation gaps between students of color and white peers continue to narrow at the same time.
- We've covered all but 4 percent of Colorado kids with health insurance.

Of course, each edition of KIDS COUNT allows us to see what still needs to be done to support Colorado children. A huge focus for my administration this year is creating the kind of workforce that will keep our state at the forefront of the new economy. We need an education system that matches that vision—and it must be adequately and equitably funded.

As you dive into this 25th Anniversary edition of KIDS COUNT, think about the investments past generations made in us. Think about what we must do for the next generation to inherit a state in an even better condition. That starts with investing in our kids today.

LETTER FROM THE PRESIDENT

March 22, 2018

The 25th Anniversary of *KIDS COUNT in Colorado!* offers us a rare opportunity in our busy lives to take a very long view of child well-being in Colorado. It's a simple question that offers us complex answers: in the 25 years we've been tracking data on child well-being, what has changed? What hasn't?

Our research team often looks back 10 years or more to track trends in child poverty, health, education and early childhood learning and development. Since we base our policy recommendations on solid research, we want to make sure the outcomes we're seeing aren't just blips or swings.

However, when we looked back two and a half decades we were met with a few surprises. First, how much has changed for kids in Colorado. The good news: huge gains were made in the number of kids with health insurance and, in recent years, the number of low-income families with access to quality child care settings.

This swing in the right direction can be attributed in large part to research-based policy changes championed by policymakers on both sides of the aisle, and from all corners of our state.

On the other hand, as we considered how much our culture (and fashions) have changed since the early 1990s, we were disappointed to see that several challenges today's Colorado children are facing mirror those from nearly three decades ago. And some trends were even worse.

The way we send money schools across the state hasn't changed since many of us first glimpsed the internet. Our outdated and inequitable school funding formula holds Colorado students back from reaching their full potential.

Mental health should be another growing concern for Coloradans. The significant increase we've seen in the teen suicide rate in recent years is troubling and demands immediate attention.

What's our take-away after digging into the dusty archives of data reports from the past? It's a core belief of ours from our first edition to our 25th: Kids do better when the adults put them first at the Colorado State Capitol and in Washington, D.C.

Twenty-five years of data prove it. Please help us carry that message to your friends, family, and neighbors as we dive into an important election year. Kids must be a priority this year, and every year, if we want to look back on more progress for kids in the next 25 editions of *KIDS COUNT in Colorado!*

Sincerely,

Kelly Causey, Ph.D.

Introduction

Big birthdays are an opportunity to pause and reflect. It's a time to think about highs and lows of the past, and consider what we need to change now to accomplish our goals in the future. That contemplation was no different as we dug into our archives of 25 years of *KIDS COUNT in Colorado!*

During the past 25 years, KIDS COUNT has used data to help call attention to emerging trends impacting kids in communities across the state. The first edition in 1993 set a baseline for measuring child well-being in the years to come. In 1999, the report assessed the progress Colorado made toward big goals the Children's Campaign and its partners set for the year 2000. The 2008 edition sounded the alarm about the skyrocketing number of Colorado kids experiencing poverty, and in 2011, KIDS COUNT shined a light on the ways the Great Recession left its mark on hundreds of thousands of kids in our state.

While the focus of each report through the years may have differed slightly, we've had the same goal for each edition. Whether you are a parent or policymaker, a governor or grandparent, we want to provide you with the data and analysis you need to make informed decisions about children in Colorado communities. This year, we marked the 25th birthday of *KIDS COUNT in Colorado!* by exploring this important question:

What has changed for Colorado kids in the past 25 years? Long-term trends are not possible for every indicator, but a few powerful success stories emerged as we contemplated 25 years of data on Colorado kids. Colorado's infant mortality rate in 2016 was nearly half of what it was 25 years earlier. Our teen birth rate plummeted by nearly 70 percent, and our uninsured rate for kids reached a record low in 2016. The number of available spaces in early learning programs like the Colorado Preschool Program climbed steadily, and the share of Colorado kindergartners enrolled in a full-day program increased five-fold. Behind each of these numbers are real children who are better off as a result of policy decisions that contributed to these trends.

The data in this report also show us where Colorado has work to do if we want to celebrate more progress for kids 25 years from now. In 2015, our state's teen suicide rate—consistently one of the highest in the nation—reached a rate not seen in the previous 25 years. Although infant mortality rates have declined overall, they remain unacceptably high for black babies—in part due to the stress and discrimination their mothers face. Our school funding system hasn't been updated in nearly a quarter of a century. The reading scores of our fourth graders have been stagnant for nearly a decade, with only about two in five of them reading proficiently in this critical year of learning.

The improvements—and challenges—highlighted in this report show us that **sound data and public policy matter** to our children. Although the factors driving each of these trends are complex, we can point to specific, research-based policy decisions during the past 25 years that helped connect more Colorado kids to health insurance, provided additional contraceptive options for young women, or increased the funding available for our state's early learning programs. We know that with smart, data-driven public policy, Colorado can remove obstacles to success that kids in our state *still* face.

Sometimes child advocates need to take a long view to see how much we can accomplish. To know that we are making progress for kids through a combination of good data, thoughtful public policy and dedicated advocacy. Coloradans who speak up for children in classrooms, communities and at the State Capitol are making a difference.

Here's to working together on behalf of kids for another 25 years, and to looking back on 50 years of incredible progress. It will be here before we know it.

Ensuring that every kid counts starts with the Census. Numerous data sources have been introduced in the past 25 years, but the Census—conducted every 10 years since 1790—remains fundamental to informing our understanding of important issues affecting our state. Although the connection between the Census and kids may not be obvious at first glance, the decennial Census serves as the foundation for dozens of data points throughout this report.

The next Census will be conducted in 2020 and while preparations are well underway, it currently faces many obstacles to providing communities with important data. Congress has underfunded the Census in the critical years leading up to the Census count. That is a short-sighted decision given that the 2020 Census will be the first to be administered largely online. And, proposals to add a question about citizenship status to the Census threaten to depress response rates.

An accurate 2020 Census is vital to our kids, families and communities. Without it, our ability to understand and monitor the pressing challenges we face would be hamstrung. On this 25th anniversary of *KIDS COUNT in Colorado!*, let's ensure that advocates and policymakers in our state continue to have access to the reliable data needed to make informed decisions about the kids in our communities. Stay tuned in the coming months to find out how you can ensure **every child** in your community counts in 2020.

In 2017, we dedicated our KIDS COUNT report to exploring the root causes and implications of disparities between Colorado's kids of color and their white peers. Although the 2018 report does not focus explicitly on racial equity, we remain committed to using data as a tool to work toward a more equitable Colorado for kids of all races and ethnicities. As part of this commitment, we have continued to disaggregate data by race and ethnicity for as many indicators as possible throughout this report. This year's report does not include an examination of the historical context of racial inequities; however, it is critical to note that when disparities exist, they are a direct result of policies and practices that have often built barriers for children and families of color—not a result of differences in the potential or abilities of children. For more information on the historical context behind racial and ethnic gaps in child well-being, we encourage you to read our *2017 KIDS COUNT in Colorado!* report, available on our website at coloradokids.org.

DEMOGRAPHICS

AS COLORADO'S CHILD POPULATION GROWS, IT IS VITAL THAT WE EQUIP EVERY CHILD WITH THE SKILLS AND RESOURCES HE OR SHE WILL NEED TO THRIVE.

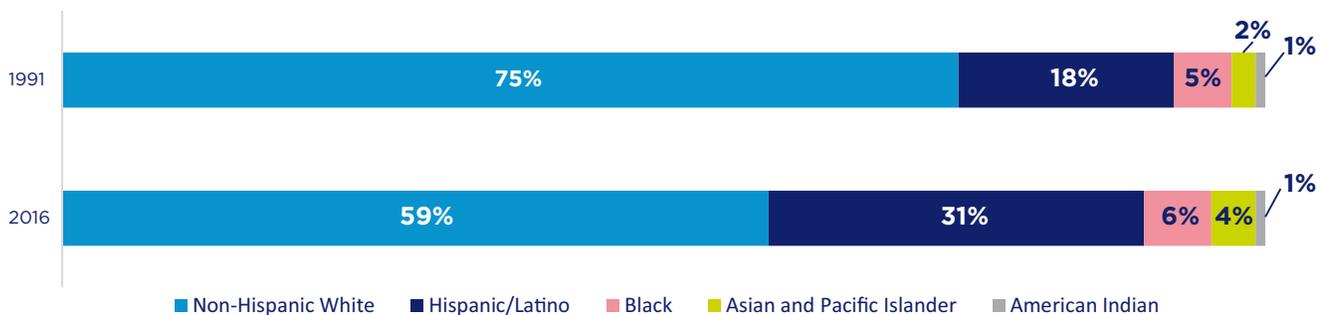

Colorado's Changing Demographics

The first edition of *KIDS COUNT in Colorado!* noted the racial diversity of the state's children, and Colorado's child population has grown more diverse in the subsequent years. As the makeup of Colorado's child population has changed, the racial and ethnic categories used to describe the diversity of Colorado's population have shifted as well.

If you were to compare the racial and ethnic categories included in the 1993 KIDS COUNT report to those we use today, you would probably notice some differences. For example, the Two or More Races category is missing from the 1993 report because the category was not standard on federal forms until 1997. You might also notice that under the old guidelines for reporting data by race and ethnicity, the Native Hawaiian/Pacific Islander category was combined with the Asian category.

Race is not based on any biological factor, and the federal government occasionally revises racial and ethnic categories to better reflect how people identify themselves or to update outdated terminology. These revisions, while helping to ensure people see their racial identity reflected in surveys, constrain the ability to make comparisons over time. Fortunately, a trio of federal agencies produces modified estimates that can be used to examine long-term trends. Below are the modified estimates that compare the racial and ethnic makeup of the child population in 1991 and 2016. The next page includes a breakdown of Colorado's child population using the seven racial and ethnic categories for which data are currently collected.

Racial and Ethnic Makeup of Colorado Children Under 18: Then and Now

Since 1991, Hispanic/Latino kids in Colorado saw the largest *numerical* increase in population. The number of Hispanic/Latino children grew by more than 230,000 kids between 1991 and 2016.

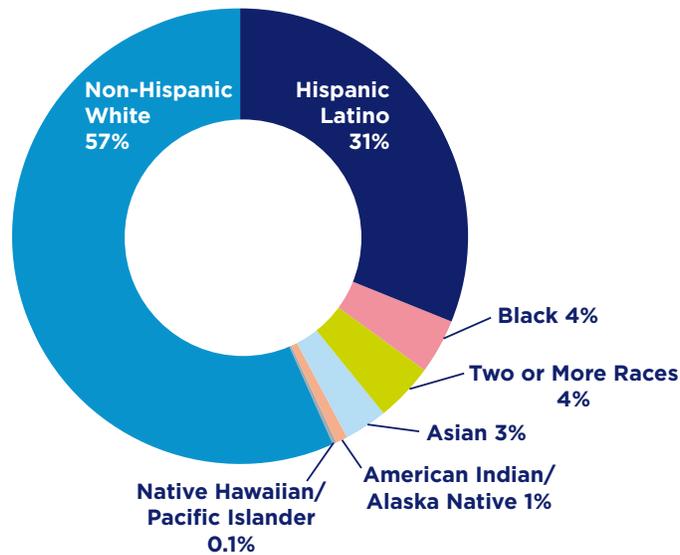

Asian and Pacific Islander children saw the largest *percentage* increase between 1991 and 2016, growing by 162 percent.

Source: Population Reference Bureau, analysis of Centers for Disease Control (CDC), National Center for Health Statistics (NCHS), 1999 intercensal estimates for 1990-1999 and vintage 2016 postcensal estimates for 2010-2016, by single year of age, bridged race, Hispanic origin and sex. Data files prepared under a collaborative arrangement between CDC/NCHS and the U.S. Census Bureau. Accessed online at www.cdc.gov/nchs/nvss/bridged_race/data_documentation.htm#vintage2016 (Jan. 17, 2018).

Colorado's Changing Demographics

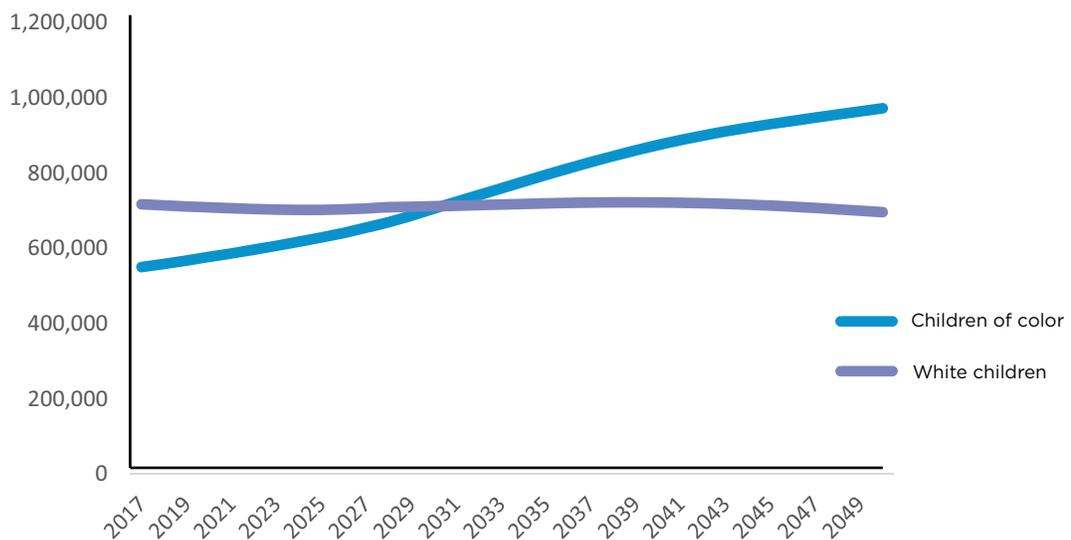

Using the current racial and ethnic categories, children of color make up approximately 43 percent of all Colorado children as of 2016, up from 24 percent in 2000. Non-Hispanic white children are still the majority among Colorado kids, but forecasts show our state's child population growing more diverse in the years to come.^{3,4}

Racial and Ethnic Makeup of Colorado's Child Population: 2016

Population forecasts predict that children of color will become the majority in Colorado in 2031. By 2050, kids of color are projected to make up 58 percent of all Colorado children under the age of 18.⁵

⁵ *Ibid.*

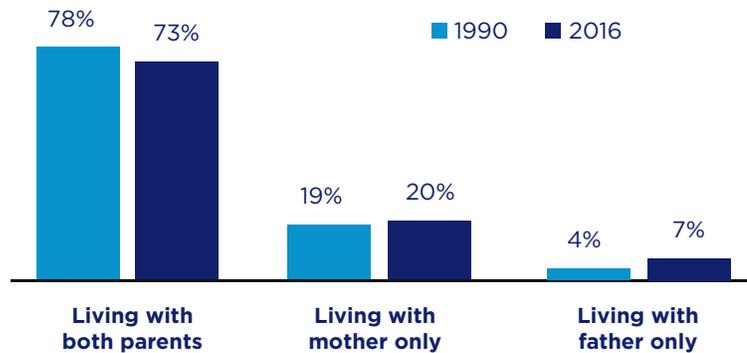

Who are Colorado's families and how have they changed during the past 25 years?

The 1993 KIDS COUNT report noted changing family contexts between 1980 and 1990. Since the initial report was released, the family environments in which children grow up have continued to change and shift.

Between 1990 and 2016, the percent of Colorado kids living with single parents increased slightly from 23 percent to 27 percent.⁶

Despite this increase, Colorado kids remain more likely to live with both parents than their peers across the U.S. Much of the increase in the percent of kids in single-parent families was driven by a growing number of kids living in households with single fathers.

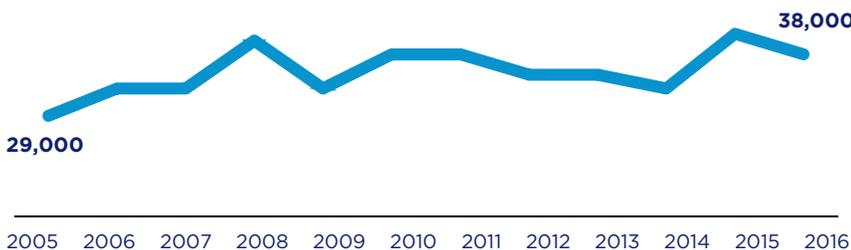

The number of Colorado kids living with single parents increased between 1990 and 2016.

Mirroring a national trend, a growing number of Colorado kids are in the care of their grandparents.

In 2016, 3 percent of Colorado kids (38,000 children) lived in households where a grandparent served as their primary caregiver.⁷ Nationally, a growing number of grandparents are raising their grandchildren, with the number of kids who have a grandparent as their primary caregiver reaching 2.9 million in 2015. Some experts point to drug addiction, particularly the growing problem of opioid abuse, as the primary driver of this trend.⁸

In 2016, nearly 40,000 Colorado kids had a grandparent as their primary caregiver.

Children in Immigrant Families

Colorado has for centuries been a draw for those from other countries who are seeking economic opportunity and a better life—for themselves and for their children. Throughout history, families who have immigrated to Colorado have made significant contributions to the vibrancy and diversity of our state.

In 2016, nearly one in four kids in Colorado lived in an immigrant family.⁹ A child in an immigrant family is a child who was either born outside of the United States or, more commonly, a child who was born in the U.S. with at least one parent born in another country.

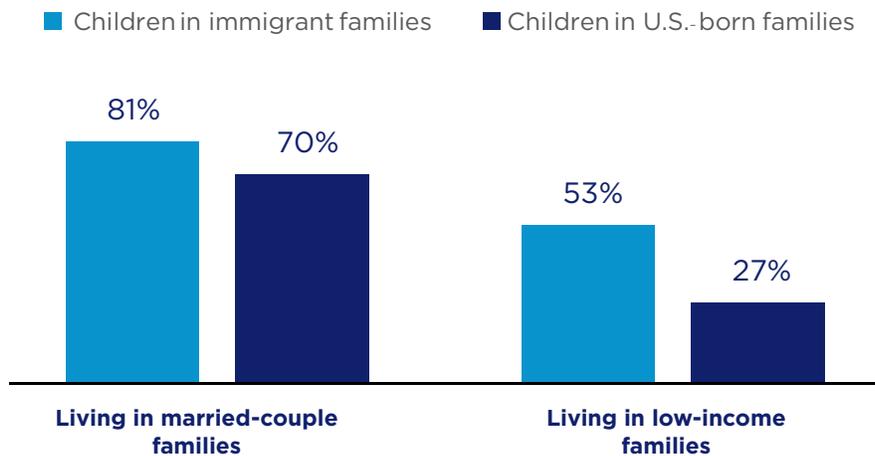

Nine out of every 10 Colorado kids in immigrant families (90 percent) were U.S. citizens as of 2016, up from 82 percent in 2005.¹⁰ Approximately 47 percent of Colorado’s kids in immigrant families lived with parents who were not U.S. citizens in 2016.¹¹

Colorado’s kids in immigrant families are more likely to live in married-couple families than their peers in U.S.-born families. Living with two parents is generally associated with greater economic security, given the potential for a family to have two income-earners. However Colorado kids in immigrant families are more likely to live in families that meet the definition of low-income (those with an annual income below 200 percent of the federal poverty level).¹² This disparity is likely due in part to the fact that some groups of immigrants lack the same labor market protections afforded to native-born workers.

A recent study found that as adults, the children of immigrants contribute more in taxes than other native-born Americans, and are one of the strongest economic contributors in the U.S. population.

Source: The National Academies of Sciences, Engineering, and Medicine. (2017). *The Economic and Fiscal Consequences of Immigration*.

Colorado’s kids in immigrant families are more likely to live with both parents, and are almost twice as likely to live in low-income families.

The boy, on the right, has dark, curly hair and is wearing a blue and white plaid shirt. He is looking up at the man with a bright, happy smile. The background is a soft-focus outdoor setting with green grass and a blurred white fence or railing. The lighting is bright and natural, suggesting a sunny day.

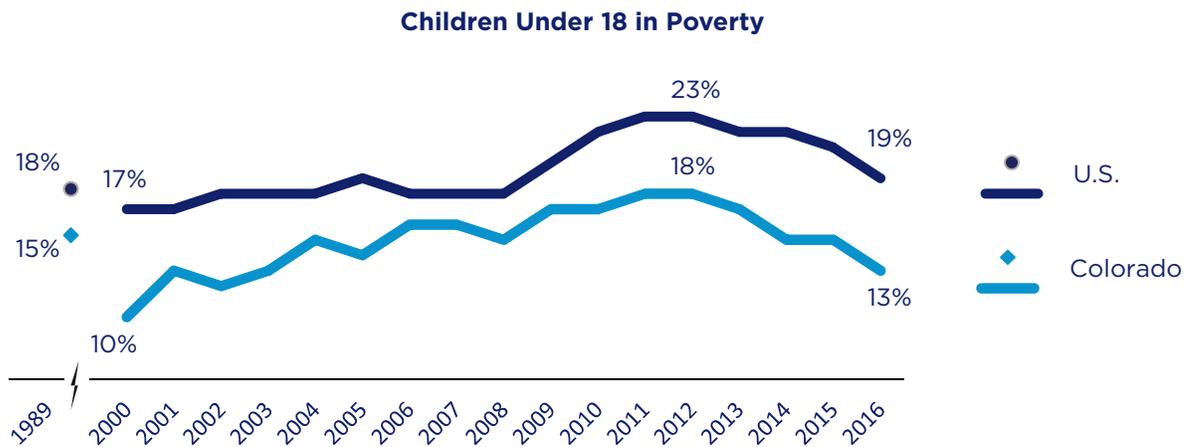

FAMILY ECONOMIC SECURITY

**OUR VISION FOR KIDS:
ALL COLORADO CHILDREN
ARE ECONOMICALLY
SECURE.**

Child Poverty

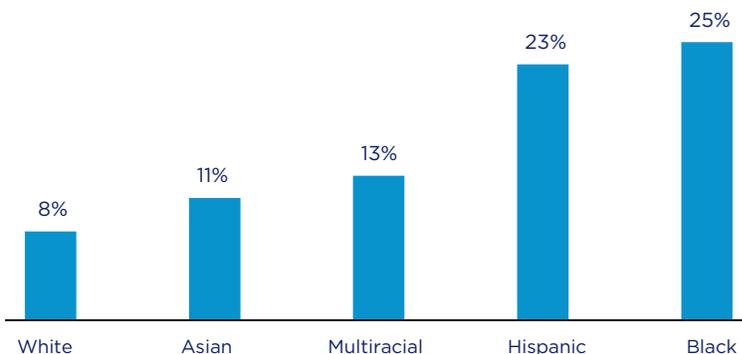

In 2016, 13 percent of Colorado children (approximately 166,000 kids) lived in poverty, down from 15 percent (183,000 kids) in 2015 and Colorado's lowest child poverty rate since 2003.¹³

More than 25 years ago, the Colorado Children's Campaign declared the 1990s the Decade of the Child and set forth 12 bold goals for improving child well-being. Among those was a goal that by 2000, Colorado's child poverty rate would be no higher than 8 percent. Data show that—while Colorado has seen an encouraging trend in its child poverty rate since 2012—at no point during the last 25 years has the state's child poverty rate been as low as 8 percent.

Colorado families of all backgrounds work hard to provide a better life for their children. Families of color, however, face additional barriers to economic security due to a history of inequitable policies and practices.

Child Poverty Rates by Race/Ethnicity, 2016*

*Single-year poverty rates for American Indian children and Native Hawaiian/Pacific Islander children are unavailable due to a small sample size. Reliability of estimates can be increased by examining five-year aggregations of data. During the five-year period from 2012 to 2016, 31 percent of Colorado's American Indian/Alaska Native children and 39 percent of Native Hawaiian/Pacific Islander children experienced poverty. Note that these five-year estimates should not be compared to the single-year estimates in the above graph.

Throughout our country's history, policies and practices have helped move some families along the path to economic security while putting up roadblocks for others. Practices such as redlining in the housing market, employment discrimination and inequitable criminal justice policies have created circumstances in which children of color are more likely to experience poverty than their white peers. The 1993 KIDS COUNT report noted a racial and ethnic inequity in child poverty rates, and it persists 25 years later.

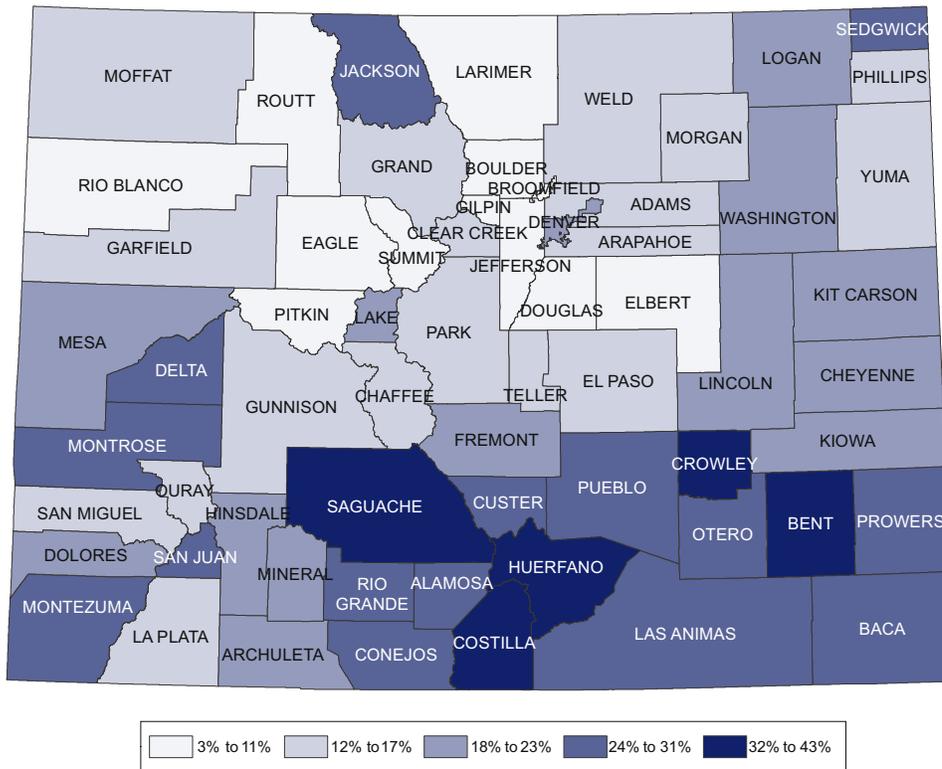

¹³ Population Reference Bureau analysis of data from the U.S. Census Bureau's American Community Survey 1-Year Estimates.

Child Poverty by County

No community is immune to child poverty—even those that by other economic measures appear wealthy. Nevertheless, employment opportunities, wages, and access to work supports such as child care, differ across the state, leading to significant variation in child poverty rates from county to county.

In 2016, **Costilla County** in the San Luis Valley had the highest child poverty rate in the state, at 43 percent. **Douglas County**, just south of Denver, had the lowest child poverty rate, at 2.9 percent.

Child Poverty Rates by County, 2016

Source: U.S. Census Bureau, 2016 Small Area Income and Poverty Estimates.

As of December 2017, Colorado had one of the lowest unemployment rates in the nation. But have all communities felt the impact of the economic recovery?

Some state-level statistics show an economy that has bounced back from the Great Recession. Most Colorado counties have seen their child poverty rates return to near their pre-recession levels, and a few even had child poverty rates in 2016 that were significantly below their 2007 rates. Some communities, however, have yet to feel the full impact of the state’s economic recovery and have child poverty rates that remain significantly higher than their 2007 levels.

	<p>Below pre-recession child poverty rate</p> <p><i>Denver, Arapahoe and Jefferson counties</i></p>	

The 2016 Federal Poverty Guidelines

The U.S. Department of Health and Human Services issues annual guidelines defining the level of income for the poverty level for individuals and families in the United States.¹⁴ Eligibility for programs such as Medicaid, the Colorado Child Care Assistance Program (CCCAP), and the National School Lunch and School Breakfast programs is determined by using percentages of the federal poverty level (FPL).

Persons in Family or Household	100 Percent of Poverty	130 Percent of Poverty	150 Percent of Poverty	185 Percent of Poverty	200 Percent of Poverty	250 Percent of Poverty	300 Percent of Poverty
1	\$11,880	\$15,800	\$17,820	\$21,978	\$23,760	\$29,700	\$35,640
2	\$16,020	\$21,307	\$24,030	\$29,637	\$32,040	\$40,050	\$48,060
3	\$20,160	\$26,813	\$30,240	\$37,296	\$40,320	\$50,400	\$60,480
4	\$24,300	\$32,319	\$36,450	\$44,955	\$48,600	\$60,750	\$72,900
5	\$28,440	\$37,825	\$42,660	\$52,614	\$56,880	\$71,100	\$85,320
6	\$32,580	\$43,331	\$48,870	\$60,273	\$65,160	\$81,450	\$97,740
7	\$36,730	\$48,851	\$55,095	\$67,951	\$73,460	\$91,825	\$110,190
8	\$40,890	\$54,384	\$61,335	\$75,647	\$81,780	\$102,225	\$122,670

Measuring Poverty: What Has Changed Since 1993?

When it comes to how the federal government measures poverty, what has changed since the first KIDS COUNT report was released in 1993? The answer: not much.

Although the government updates the federal poverty level each year to account for inflation, it has made no meaningful updates to the assumptions underlying the federal poverty level since the early 1960s. When initially developed, the federal poverty level was based on food costs. Since the average family in 1960s America spent one-third of its income on food, the government tripled the cost of a “thrifty meal plan” to calculate the amount of income that would serve as the cutoff point for whether an individual or family was considered to be living in poverty.¹⁵ The average family’s expenses, however, have changed since the measure was initially devised. Food is no longer such a large portion of an American household’s budget. Housing, transportation, health care and child care costs, which make up increasing shares of family expenses, have risen dramatically, but they are not considered in calculating the federal poverty level. Consequently, most experts agree that the federal poverty measure underestimates the true cost of supporting a family.

Failing to account for differences in the cost of living is another shortcoming of the federal poverty level. With the exception of Hawaii and Alaska, the federal poverty level does not vary across the United States—despite significant differences in the cost of living. According to the *Self-Sufficiency Standard for Colorado 2015*, the cost of living for a two-parent family with an infant and a preschooler in Pitkin County is nearly twice as high as the cost of living for a similar family in Bent County.¹⁶ Despite these differences, the federal poverty level is the same in both communities. As a result, the number of kids living in families who are struggling to afford basic necessities is likely much higher than reported, especially in communities with a high cost of living.

A New Approach to Measuring Poverty

Although the U.S. still relies on an outdated measure of poverty for its official estimates, researchers have begun to innovate new and better ways of quantifying the amount of income the average American family requires to meet basic needs. The Supplemental Poverty Measure (SPM), developed by the Census Bureau with help from other government agencies, provides a more accurate picture of a family's economic circumstances by mitigating several of the official poverty measure's flaws. While the federal poverty level (FPL) only considers pre-tax income and cash benefits, the Supplemental Poverty Measure takes into account common expenses such as health care costs, transportation expenses and taxes.

How Resources are Calculated Using the Supplemental Poverty Measure

Graphic created from information in: Short, K. (2014). The Supplemental Poverty Measure: 2013.

Because the Supplemental Poverty Measure also considers the impact of government benefits such as the Earned Income Tax Credit (EITC) and benefits from the Supplemental Nutrition Assistance Program (SNAP, formerly known as food stamps) when calculating a family's income, it also allows researchers to examine how effective these programs are at keeping families out of poverty. The Census Bureau found that refundable tax credits such as the Earned Income Tax Credit and the Child Tax Credit kept nearly 4.4 million American children out of poverty in 2016. Programs that focus on improving child nutrition also had a significant impact on poverty; the Supplemental Nutrition Assistance Program (SNAP) kept more than 1.5 million American kids out of poverty, while the National School Lunch Program decreased the number of kids in poverty by 762,000.¹⁷ Currently, there are no plans to replace the official poverty measure with the Supplemental Poverty Measure, but the SPM provides a helpful comparison to the poverty rates derived from the official measure.

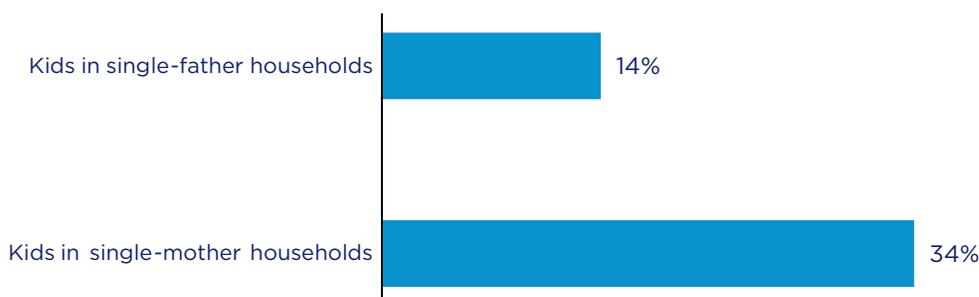

¹⁷ Fox, L. (2017). The Supplemental Poverty Measure: 2016. Washington, DC: U.S. Census Bureau.

Poverty, Income and the Wage Gap

Children in single-parent families are more likely to experience economic hardship than kids in two-parent families, due to the fact that there is often only one potential income-earner in the family. But the prevalence of economic hardship still differs between kids being raised by single mothers and those raised by single fathers. Data in the 1993 KIDS COUNT report showed that Colorado children living in households headed by single women were 2.1 times more likely to live in poverty than those living in households headed by single men.¹⁸ What does this pattern look like today, and has Colorado made progress toward correcting this inequity?

Data from the 2016 American Community Survey show that the disparity in poverty rates between children being raised by single mothers and those being raised by single fathers has widened since the first KIDS COUNT report was released. In 2016, Colorado kids in families headed by single mothers were 2.4 times more likely to live in poverty than their peers in families headed by single fathers.

Poverty Rates for Colorado Children in Single-Parent Families, 2016

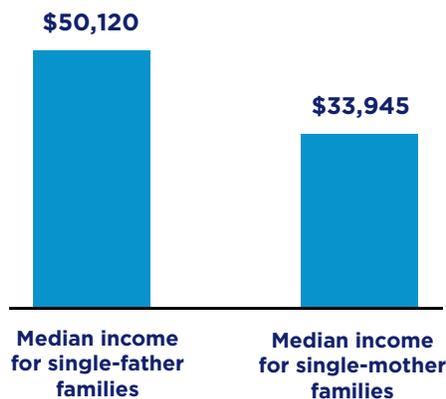

The reasons behind this disparity are complex, but the wage gap between women and men is one contributing factor. Nationally, women earn about 80 cents on the dollar in comparison to what men are paid—only slightly better than in 1991, when women earned about 70 cents for each dollar a man earned.¹⁹ Colorado’s gender wage gap is slightly narrower than the national average, but Colorado women who worked full-time, year-round in 2016 still only earned 84 cents for every dollar a full-time, working man earned.²⁰

As more women become the sole or primary breadwinners for their families, the gender wage gap has significant implications for children’s economic security.

In Colorado, approximately 241,000 kids lived with single mothers in 2016.²¹ Most of these children rely on their mothers’ earnings. Research suggests that correcting the gender wage gap could dramatically improve children’s economic circumstances. A study conducted by the Institute for Women’s Policy Research found that if working women were paid comparably to men of the same age, similar levels of educational attainment, and similar hours of work, the number of U.S. kids with working mothers living in poverty would be cut nearly *in half*.²² During the next 25 years, how can we make sure that all of our children—whether they’re being raised by both parents, a single woman, a single man, grandparents or other family members—have the economic resources needed to support their success?

Affordable Housing

From the Eastern Plains to the Western Slope, Coloradans across the state report increasing difficulty finding housing that is affordable for their families. In 2016, nearly one in three Colorado children (approximately 390,000 kids) lived in households that were housing cost-burdened, defined as spending more than 30 percent of income on housing expenses.²³

No child should ever have to wonder where she'll be sleeping tonight—or if she'll have a safe, warm place to sleep at all. Due to a shortage of affordable housing that Coloradans in many communities report has reached near-crisis levels, too many Colorado kids open their eyes each morning not knowing if they'll go to bed in the same place later that evening. Imagine the stress you might feel, going through the day not knowing if you'll have a safe place to sleep at night—how hard it would be to pay attention to a teacher or to concentrate on homework.

Unstable housing circumstances can have troubling impacts on several different dimensions of child well-being. Many families experiencing housing hardship end up sharing housing with other families (often referred to as doubling- or tripling-up). While families who are doubled-up may have a roof over their head, crowded housing situations can be chaotic, leaving children without a safe and quiet place to read, color or do homework. Research shows that kids who live in these overcrowded settings have poorer academic achievement and are at higher risk for behavioral problems.²⁴ Health problems can also arise from living in poor-quality housing. Studies have attributed the higher prevalence of asthma among children in low-income families to their higher likelihood of living in substandard housing.²⁵ Children who are without shelter entirely face significant stress and instability that can impede their development and hinder their ability to succeed in school.²⁶

Housing is foundational to kids' well-being. As rents and home prices in many communities continue to rise, our state must explore solutions for ensuring every child has a safe and stable place to call home.

HOUSING BY THE NUMBERS:

56 percent: The increase in Colorado's median home value between 2011 and 2016.

42 percent: The increase in Colorado's median rent between 2011 and 2016.

21 percent: The increase in median income for families with kids between 2011 and 2016.

23,954: The number of students in grades pre-K through 12 identified by Colorado school districts as experiencing homelessness in the 2015-2016 school year—nearly double the number identified in 2007-2008.

141,000: The number of Colorado kids living in crowded housing in 2016.

CHILD HEALTH

OUR VISION FOR KIDS:

ALL COLORADO CHILDREN
HAVE QUALITY, AFFORDABLE
HEALTH CARE, INCLUDING
PHYSICAL, MENTAL AND
ORAL HEALTH SERVICES, AS
WELL AS THE COMMUNITY
ENVIRONMENTS AND
SUPPORTS NEEDED TO BE
HEALTHY.

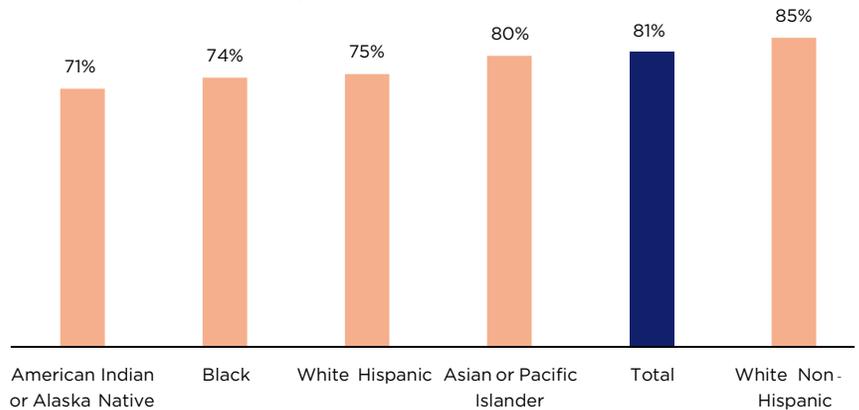

Access to Early Prenatal Care

In 2016, 81 percent of babies born in Colorado were born to mothers who received early prenatal care, only slightly above 1991 levels.²⁷

During the past quarter century, Colorado has made little progress toward increasing the percent of births to women who receive early prenatal care; the first KIDS COUNT report highlighted that in 1991, 78 percent of all births were to moms who had early prenatal care.²⁸ The 1993 KIDS COUNT report also noted racial and ethnic disparities in early prenatal care rates, which persist today.²⁹

For both mother and child, early and regular prenatal care helps to support a healthy pregnancy and birth. Through prenatal visits beginning in the first trimester, expectant mothers receive essential tests and exams, and are able to have many of their health questions answered by their provider. Regular prenatal care has been shown to reduce both the risk of pregnancy complications to the mother, as well as the risk of complications to the fetus and infant.³⁰

Births to Colorado Women Receiving Early Prenatal Care, 2016

Research shows that expanding health insurance coverage alone may not be enough to improve access to early prenatal care, and that insurance expansions may need to be paired with care coordination and outreach activities that help women overcome additional barriers to early prenatal care.³¹

Most common health topics women reported discussing with their providers during prenatal visits:

- Cigarette use (92 percent)
- Testing for birth defects (91 percent)
- Alcohol use (85 percent)
- Signs of pre-term labor (83 percent)
- What to do if depression occurs during or after pregnancy (78 percent)

Progress for Kids: A Plummeting Teen Birth Rate

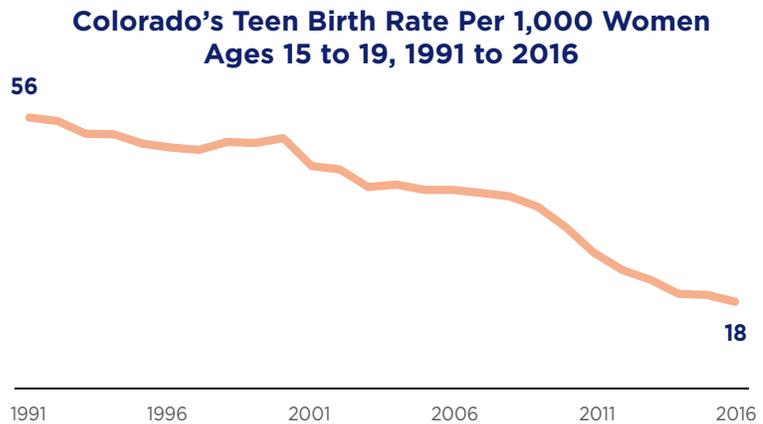

Colorado's birth rate to women ages 15 to 19 hit a historic low in 2016, falling to 17.8 births per 1,000 women in this age group. Since 1991, the state's teen birth rate has fallen by 68 percent.³²

Women of all ages fare better when they are able to plan their pregnancies in ways that are right for them. According to health survey data, however, 39 percent of Colorado women who are pregnant did not intend to get pregnant at the time, and this rate has historically been even higher for women who become pregnant as teenagers.³³ Scarce resources and lack of support can compound the challenges of starting a family as a teenager.

Pregnancy and childbirth in a woman's teenage years can have significant socioeconomic impacts on her life due to a lack of comprehensive support. Many women who have children as teenagers are still working to complete their education, and without support (including resources like child care, as well as social and emotional support), they are less likely to graduate from high school or earn as much as women who have children later in life. Only half of women who have children as teenagers are able to attain a high school diploma by age 22; in comparison, almost 90 percent of adolescent girls who do not experience childbirth during their teen years go on to earn a high school diploma.³⁴ The children of adolescent mothers are impacted by early pregnancy as well, as they are more likely to see increased health issues in childhood and lower levels of achievement in school.³⁵ Later in life, these children are more likely to experience a teen pregnancy themselves, drop out of school, and face unemployment in young adulthood.³⁶

Public Policy Spotlight

While many factors have contributed to the declining teen birth rate, one important contributor is the increased availability of long-acting, reversible contraceptives (LARCs) such as IUDs or hormonal implants. The Colorado Family Planning Initiative (CFPI) has been providing LARCs at no cost to low-income women in Title X family planning health centers since 2009. In 2016, the percentage of Title X clients using LARCs continued to grow, reaching 34 percent, showing that when cost is not a barrier, more women choose these most effective methods of birth control.³⁷ Just under 7,000 LARC placements occurred in 2016, and cumulatively, 49,713 placements have been completed since CFPI began this work in 2009.³⁸

³⁷ Colorado Department of Public Health and Environment, Health Statistics and Evaluation Branch.

³⁸ *Ibid.*

All racial and ethnic groups have experienced declining teen birth rates in recent years, but disparities persist, showing that Colorado has more work to do to ensure young women of all backgrounds have the support they need to plan their families in ways that work for them. Between 1991 and 2016, the teen birth rate plummeted from 116 per 1,000 to 30 per 1,000 among Hispanic teens, from 117 to 22 per 1,000 among black teens, and from 64 to 12 per 1,000 among American Indian/Alaskan Native teens.³⁹ Across the same time period, the teen birth rate among White/Non-Hispanic teens fell from 38 to 10 per 1,000, and from 32 to 7 per 1,000 for Asian/Pacific Islander adolescents.⁴⁰

**Teen Birth Rates in Colorado by Race/Ethnicity, Selected Years
(Rate per 1,000 Women Ages 15 to 19)**

Data show that the abortion rate for Colorado teens has also dropped substantially, falling by 64 percent since 2009, from 10.3 to a rate of 3.8 abortions per 1,000 teens aged 15 to 19.⁴¹ Coupled with the sharp decline in teen births, the fall in the teen abortion rate indicates that fewer teen girls are becoming pregnant, though teen sexual behavior has remained stable since the early 2000s.⁴²

The 1993 KIDS COUNT report highlighted a Decade of the Child goal of no more than 25 births per 1,000 women ages 15 to 19. In 1991, only five Colorado counties (out of 54 counties with published teen birth rates) had rates lower than 25.⁴³ By 2016, in addition to the overall state rate being below that number, 28 counties (out of 47 with published teen birth rates) reported rates under 25, including nine counties with rates lower than 10.⁴⁴

Births to Women without a High School Diploma or GED

1991:
18%

2016:
12%

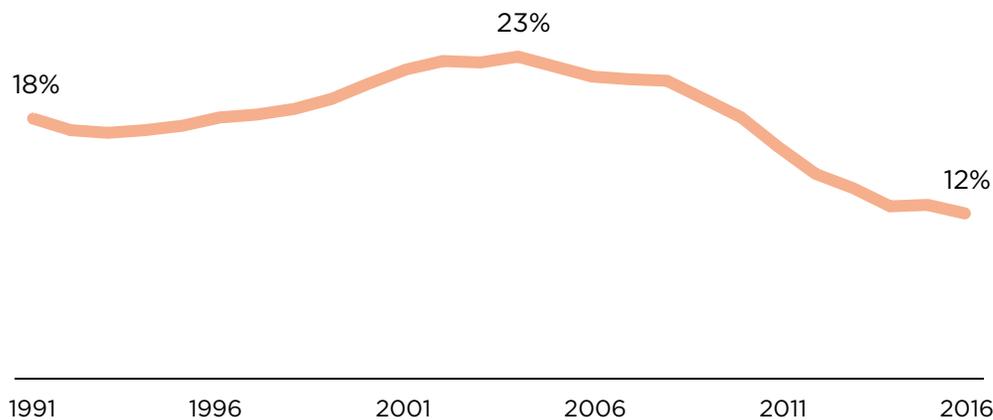

Peak: 2004
23%

Low: 2016
12%

In 2016, 12 percent of babies born in Colorado were born to women without a high school diploma or GED, down from 18 percent in 1991.⁴⁵

A large body of research demonstrates that a mother’s educational attainment is linked to the development and well-being of her child. Due to the barriers women without a high school diploma or GED face, their children are more likely to live in poverty and experience health issues such as low birthweight and obesity, among others.⁴⁶ In kindergarten, children of parents with lower levels of education score lower in math and reading; the trend continues into eighth grade, at which point children of parents without bachelor’s degrees are less likely to demonstrate proficiency in these same core subjects.^{47,48}

Births to Colorado Women Without a High School Diploma or GED, 1991 to 2016

The drop in births to Colorado women without a high school diploma or GED is likely due to several factors, including the declining number of births to teen girls who typically have not had time to complete high school, as well as higher educational attainment in general among women in the U.S. since the 1990s.⁴⁹

Births to Women who Smoked During Pregnancy

In 2016, 6.2 percent of all babies born in Colorado were born to mothers who reported smoking during their pregnancy.⁵⁰ The share of babies born to mothers who smoked has fallen dramatically since 1991 when 19 percent of babies born in Colorado—nearly one in five—were born to a mother who reported smoking while pregnant.⁵¹

Smoking threatens the health of both mother and child during pregnancy. For expectant mothers, smoking increases the risk of pregnancy complications, preterm delivery, and may also be related to miscarriage.⁵² Babies of mothers who smoke are more likely to be born at a low weight and experience tissue damage in their lungs and brain; further, they are three times more likely to die from sudden infant death syndrome (SIDS).⁵³ Emerging research has also linked maternal smoking with increased inflammation at birth, possibly affecting a baby's immune system long-term.⁵⁴

Births to Colorado Women Who Smoked During Pregnancy, 1991 to 2016

In 2015, 78 percent of mothers who smoked during pregnancy reported being advised to stop smoking by their provider. Among mothers who had been smoking three months before becoming pregnant, 51 percent talked with their provider about ways to quit, and 28 percent were referred to counseling for help with quitting. Nearly 60 percent of mothers received information on how secondhand smoke could impact their babies, either during prenatal visits, after their deliveries, or in both instances.

Infant Mortality Rate

The 1993 KIDS COUNT report highlighted a goal of reducing the state’s infant mortality rate to a level no higher than 7 deaths per 1,000 live births by the year 2000.⁵⁵ The state met that goal in 1997, and the infant mortality rate has continued its decline in the years since. In 2016, Colorado’s infant mortality rate was 4.8 per 1,000 live births—down by nearly half from 1991, when it was 8.4 per 1,000 live births.⁵⁶ However, significant barriers remain for some racial and ethnic groups.

1991:
8.4 per 1,000

2016:
4.8 per 1,000

Peak: 1991
8.4 per 1,000

Low: 2012
4.6 per 1,000

The infant mortality rate measures the number of infant deaths within the first year of life from all causes, and is often used as an indicator of overall maternal and child health in the state.

In the past decade, infant mortality rates have fallen all over the country, and Colorado has been a national leader in this trend. Between 2005-2007 and 2012-2014, the infant mortality rate in the United States decreased by 15 percent overall; Colorado saw one of the largest percent changes during this time, with the rate falling by more than 20 percent.⁵⁷ In 2016, only eight states had lower infant mortality rates than Colorado.⁵⁸

Nationally, the leading causes of infant mortality are congenital malformations (commonly known as birth defects); preterm or low birthweight births; sudden unexpected infant death (SUID, including Sudden Infant Death Syndrome or SIDS); maternal complications; and unintentional injuries.

The Work Ahead: Ensuring All Babies Can Thrive

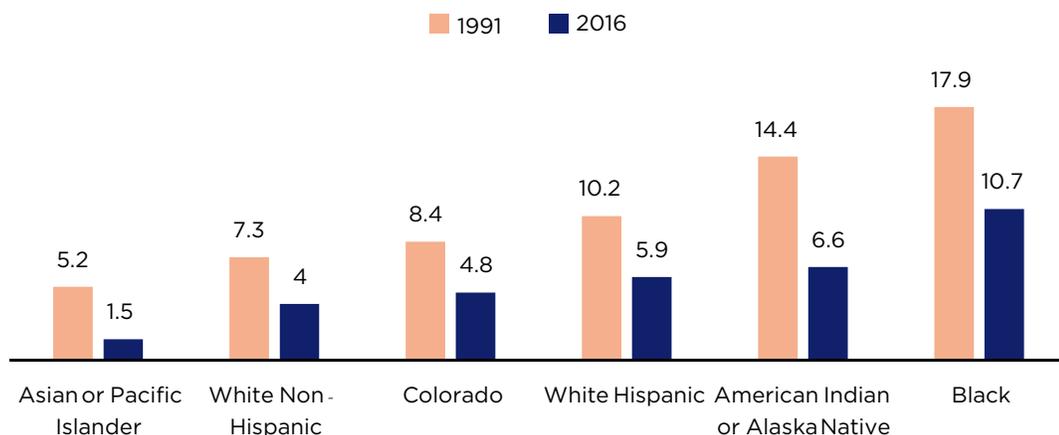

Colorado’s overall infant mortality rate is significantly below the goal outlined in the 1993 KIDS COUNT report, but the state still has work to do to ensure a healthy start for babies of all racial and ethnic backgrounds. Infant mortality rates have declined for every racial and ethnic group since 1991, but the racial disparities that existed then persist today due to inequities in many systems in our society.

The infant mortality rate for Colorado’s black babies remains particularly high, despite a decline from nearly 18 deaths per 1,000 live births in 1991 to 10.7 deaths per 1,000 in 2016. This disparity cannot be fully explained by racial disparities in parents’ income; as noted in the 2017 KIDS COUNT report, infant mortality rates remain disproportionately high for black babies, even when controlling for a mother’s income and level of education. As of 2014, a black family in Colorado making between \$50,000 and \$75,000 per year faced an infant mortality rate nearly twice as high as a white family earning less than \$15,000 per year.⁵⁹

What’s behind the high rate of mortality among black babies, if income and educational differences don’t explain it? Research conducted in Colorado helped shed new light on this question. A recent study measured cortisol, a stress hormone linked to adverse pregnancy outcomes, in pregnant women and new moms. It found that cortisol levels were much higher among black moms than among white or Hispanic moms.⁶⁰ The study is consistent with other research suggesting that the stress associated with racism, discrimination and social isolation can have tangible impacts—and in some instances, tragic impacts—on the health of moms and babies.

Colorado has proven that it can make remarkable progress on infant mortality. Let’s dedicate the same energy during the next 25 years to removing the remaining barriers to health for mothers of color and their children.

Infant Mortality Rates in Colorado by Race/Ethnicity, 1991 and 2016

Babies Born at a Low Birthweight

In 2016, 9 percent of all babies born in Colorado weighed less than 5.5 pounds, meeting the definition of low birthweight.⁶¹

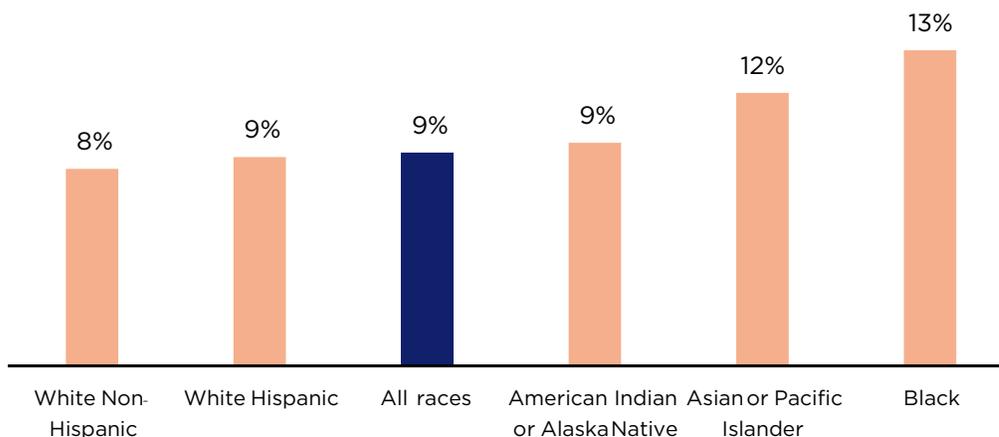

At birth, a baby’s weight is a critical indicator of their overall health. Infants born at a low birthweight are at increased risk of infection, developmental delay, and short- and long-term disabilities.⁶² Low birthweight can be caused by smoking or consuming alcohol while pregnant, inadequate weight gain, or experiencing stress, poverty, or abuse.⁶³ Research has also indicated that pregnancy at higher altitudes is associated with lower weight births, a potential concern for families in many Colorado communities.⁶⁴

Despite improvements in other indicators of maternal and child health, Colorado has made little progress toward reducing the percent of babies born at a low birthweight. The 1993 edition of KIDS COUNT reported that in 1991, 8.2 percent of babies were born at a low birthweight and noted that this rate was the highest reported since 1980.⁶⁵

Some racial and ethnic groups are more likely than others to be affected by low-weight births. A higher percentage of black and Asian/Pacific Islander infants in Colorado are born at low weights when compared to infants who are American Indian/Alaskan Native, white Hispanic and white Non-Hispanic.⁶⁶ See the section on racial disparities in infant mortality on the previous page for further discussion about the connection between race and health disparities.

Pregnancy-Related Depression (PRD)

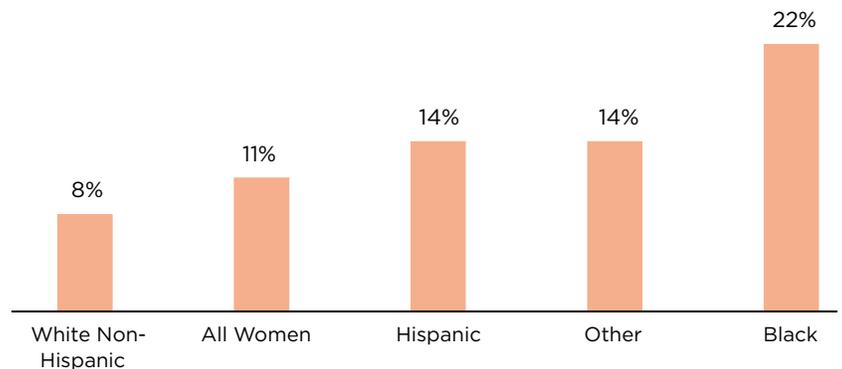

Depression that emerges during pregnancy, after birth, or after the loss of a pregnancy is common among women. In fact, depression is the most common complication associated with pregnancy.⁶⁷ Beyond posing a significant threat to the health of a new mother, maternal depression can also affect the development of the fetus and infant through increased stress chemicals in utero and parent-child interactions after birth.⁶⁸ Due to the prevalence of pregnancy-related depression, Colorado is working to increase the percentage of mothers who report talking about pregnancy-related depression with their health care provider to 80 percent by 2020.⁶⁹ The state appears to be on the right track: in 2015, 78 percent of Colorado mothers reported having a discussion about pregnancy-related depression with their provider during prenatal care, up from 73 percent in 2009.⁷⁰

Fortunately, even screening moms for symptoms of PRD can help to reduce the incidence of depression at follow-up visits.⁷¹ Screening is the first step in getting moms connected to any treatment they might need. One study found that the development of infants of depressed mothers is less likely to be impacted at one year if the mother's depression is resolved or effectively managed by the time the baby is six months old.⁷² And when mothers are aware of their depressive symptoms, they are better able to compensate for them when interacting with their child.⁷³

Pregnancy-related depression is more likely to affect younger mothers in Colorado, with those between the ages of 15 and 19 reporting the highest rates of postpartum depressive symptoms. Mothers of color also experience pregnancy-related depression at higher rates.⁷⁴ Moms of color are more likely to face barriers that limit access to many of the resources that support a healthy pregnancy and help reduce the incidence of pregnancy-related depression, including early prenatal care, family leave and health coverage. These factors, combined with the stresses of racism, discrimination and social isolation, may contribute to higher rates of PRD among Colorado's women of color.

Among Colorado women who gave birth in the previous year, nearly one in eight reported experiencing postpartum depressive symptoms.

The Work Ahead: Maternal Mortality

While infant mortality rates have declined in the U.S. during the past few decades, the same cannot be said for maternal mortality rates.

The U.S. Centers for Disease Control defines maternal mortality as the death of a woman during pregnancy or up to one year after pregnancy, due to any cause related to, or aggravated by, the pregnancy.⁷⁵ In 2015, the U.S. recorded a maternal mortality rate of 26.4 deaths per 100,000 live births in 2015, up from 16.9 per 100,000 in 1990 and significantly higher than the rates observed in other developed nations. Most other countries in the developed world saw their rates of maternal mortality decline during this time period.⁷⁶

A recent study found that maternal mortality in Colorado has increased substantially since 2008.⁷⁷ A second study examined the causes of maternal deaths among Colorado women between 2004 and 2012. Among the 211 maternal deaths identified in Colorado during the study period, the authors found that self-harm—from accidental overdose or suicide—accounted for the largest share of maternal deaths during pregnancy or within one year after pregnancy. The mortality rate associated with accidental overdose was 5 per 100,000 live births, while the mortality rate associated with suicide was slightly lower at 4.6 per 100,000.⁷⁸

Maternal Deaths by Cause: Colorado, 2004-2012

Self-harm from accidental overdose or suicide accounted for the largest percentage of maternal deaths observed in Colorado between 2004 and 2012. Among accidental overdose deaths, pharmaceutical opioids were the most common drug identified.

Graph reproduced from Metz, et al. (2016).

Among those women who died of an accidental overdose, pharmaceutical opioids were the most common drug identified. In all but one case of accidental overdose as a result of pharmaceutical opioids, evidence suggested the women had a prescription.

Communities around the country, including many here in Colorado, have struggled in recent years with skyrocketing rates of opioid abuse. The effects that opioid misuse can have on kids, families and communities are wide-reaching, but many communities have felt the particular impact of opioid use during or shortly after pregnancy. The connection between opioids and maternal death, coupled with a rising number of Colorado babies born exhibiting symptoms of opioid withdrawal, suggest a critical need for Colorado to provide more support to women who are pregnant or are new moms.

Progress for Kids: Health Coverage

In 2016, Colorado's uninsured rate for kids under 18 remained at a record low of 4 percent. Increasing the number of kids with health insurance is one of the greatest Colorado success stories of the past several years. Long-term data on kids' health coverage are not available, but the number of kids without health coverage fell by more than 120,000 between 2008 and 2016. As a result, tens of thousands of Colorado kids and families face one fewer barrier to getting the health care they need to thrive. Kids with health insurance not only have better access to the physical, mental and oral health care they need to be healthy, but they are also less likely to drop out of high school, more likely to graduate from college, and have higher incomes as adults.⁷⁹ Health insurance also protects families' economic resources and financial security, reducing toxic stress experienced by children.

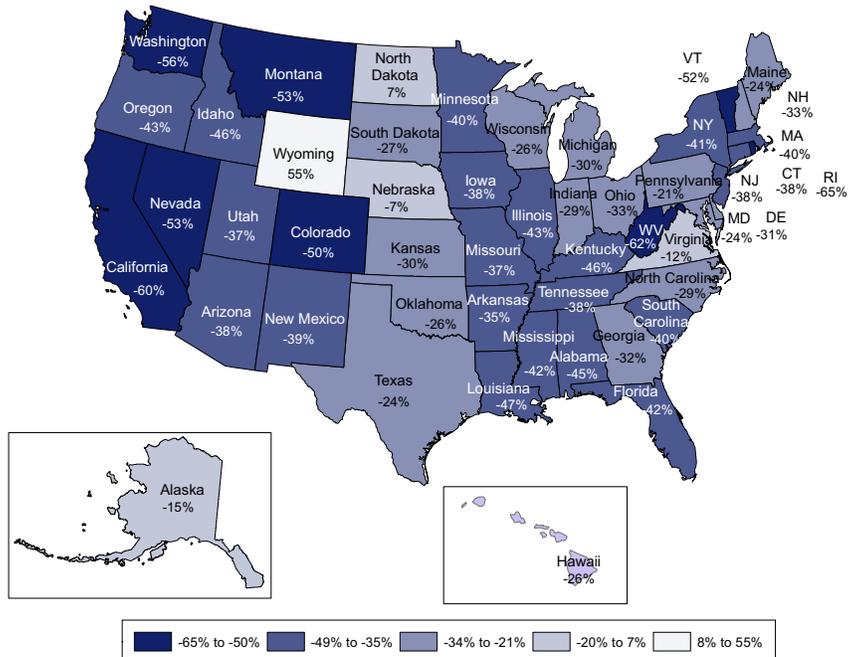

Between 2008 and 2013, Colorado chipped away at its uninsured rate for kids, thanks to state-level policy changes such as expanding the Child Health Plan Plus (CHP+) to serve children and pregnant women in families earning up to 260 percent of the federal poverty level (an annual income of \$63,960 for a family of four in 2016) and eliminating the three-month waiting period for CHP+.

Many provisions of the Affordable Care Act then took effect in January 2014 and accelerated the decline in Colorado's uninsured rate for kids. For example, Colorado chose to expand Medicaid for adults earning up to 133 percent of the federal poverty level (an annual income of \$32,319 for a family of four). Although the Affordable Care Act did not expand kids' eligibility for public coverage, research shows that children are more likely to be covered when their parents have health insurance. Medicaid expansion, together with new tax credits for families purchasing their own health insurance, helped cut Colorado's uninsured rate for kids in half in just three years. Between 2013 and 2016, Colorado experienced one of the nation's largest declines in the number of uninsured kids.

Colorado Kids Under 18 Without Health Insurance

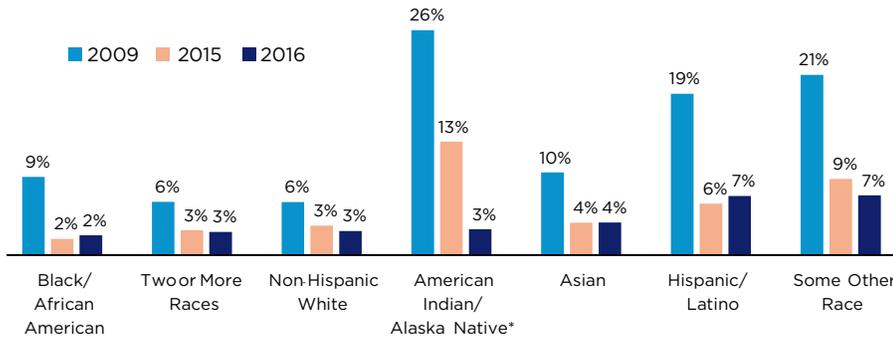

Change in the Number of Children Without Health Insurance, 2013 to 2016

⁷⁹ Paradise, J. (2014). The impact of the Children's Health Insurance Program (CHIP): What does research tell us? The Henry J. Kaiser Family Foundation: Menlo Park, CA. Retrieved from https://kaiserfamilyfoundation.files.wordpress.com/2014/07/8615-the-impact-of-the-children_s-health-insurance-program-chip-what-does-the-research-tell-us.pdf.

Children of color in Colorado experienced some of the largest gains in health coverage in recent years as barriers to insurance were removed, but kids in some racial and ethnic groups still face more roadblocks to coverage than others.⁸⁰

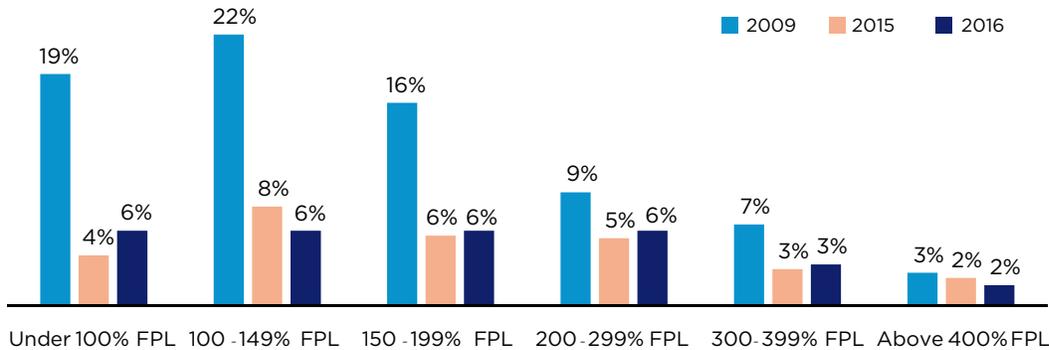

Uninsured Rates for Colorado Kids by Race/Ethnicity

**Interpret with caution due to large margin of error.*

Uninsured rates also dropped significantly for Colorado kids in poverty and those in low-income families. Between 2009 and 2016, the uninsured rate for kids experiencing poverty dropped by more than two-thirds.⁸¹ Children in families with incomes below 260 percent of the federal poverty level qualify for public coverage through Medicaid or CHP+, but Colorado had historically done a poor job connecting these eligible children to the coverage for which they qualified.

Colorado Kids Under 18 Without Health Insurance, by Ratio of Income to Poverty Level

In 2009, Colorado ranked **44th in the nation** for insuring its kids in poverty. By 2016, it had **improved to 26th** and was on par with the national average.

⁸⁰ U.S. Census Bureau's 2009, 2015 and 2016 American Community Surveys.

⁸¹ *Ibid.*

Changes in Uninsured Rates by County

Most communities across Colorado have experienced declining uninsured rates for kids, thanks to a combination of federal and state policy changes supported by strong local efforts to get kids connected to coverage.

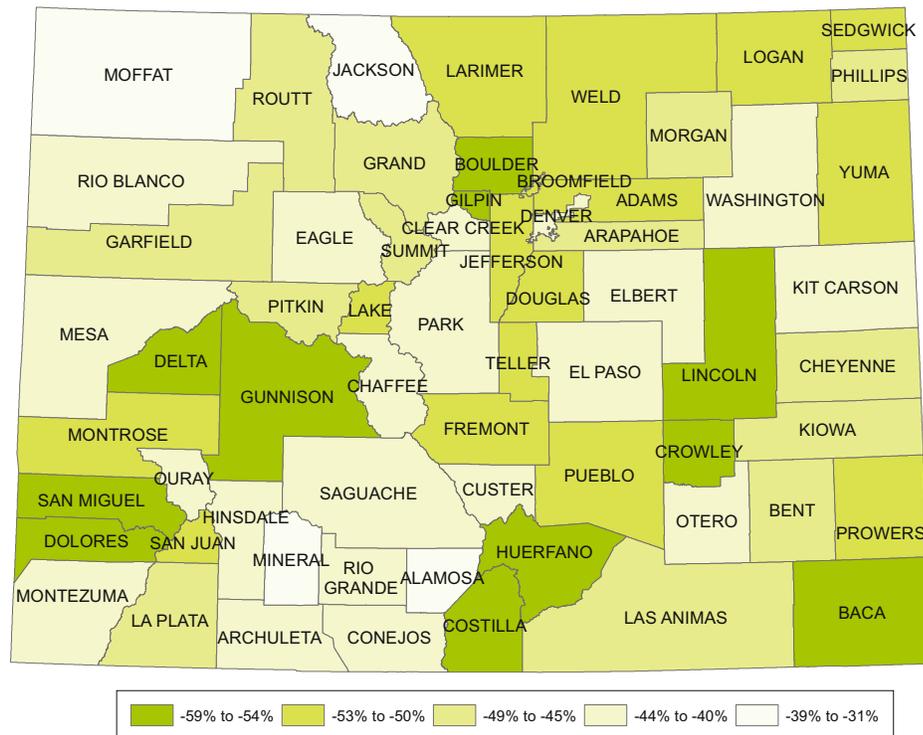

According to data from the U.S. Census Bureau's Small Area Health Insurance Estimates (SAHIE) program, 27 Colorado counties saw a reduction of at least half in the number of kids without health coverage between 2013 and 2015.

Steepest Declines in Number of Uninsured Children, 2013 to 2015

Huerfano County	59 percent
Gilpin County	57 percent
Boulder County	57 percent

Decline in Number of Kids Without Health Coverage, 2013 to 2015

A note about county-level uninsured estimates: Several data sources collect information on kids' health insurance status in order to produce county-level estimates of uninsured rates. The above map uses model-based estimates from the U.S. Census Bureau's 2015 Small Area Health Insurance Estimates program to calculate the change in number of uninsured kids in each county. The uninsured rates included in the county data sheets at the back of the book are Colorado Health Institute estimates created using the Census Bureau's 2016 American Community Survey. Each source uses a different methodology to calculate its estimates, and data from one source should not be compared to the other.

Public Health Coverage

Recent years have seen fewer Colorado kids covered by health insurance provided through their parents' employers. As the share of Colorado kids covered by employer-sponsored insurance declines, public coverage has become an increasingly important source of health coverage for Colorado's children.

Public coverage programs like Medicaid and the Child Health Plan *Plus* (CHP+) are critical to hundreds of thousands of kids in Colorado. In state Fiscal Year 2016-17, more than half of Colorado kids from birth to age 18 were covered by Medicaid or CHP+ at some point during the year.⁸²

These programs serve as a lifeline for many working families, ensuring their children can get regular well-child check-ups, screenings for vision or hearing problems and important immunizations, among other services. People covered by Medicaid as children experience benefits that last into adulthood; one study found that children enrolled in Medicaid during their early years had better overall health as adults, as measured by blood pressure, diabetes diagnoses, heart health, and weight.⁸³

Public coverage programs not only help ensure kids can access the care they need to grow up healthy and strong—they also help fight poverty by protecting a family's financial resources. A 2017 study examined the impact of health benefits on poverty rates and found that Medicaid decreased the child poverty rate more than all other non-health means-tested programs combined.

Source: Remler, D.K., Korenman, S.D., & Hyson, R.T. (2017). *Health Affairs* 36(10), pp. 1828-1837.

In Colorado:

Medicaid covers children in families with a modified adjusted gross income at or below 142 percent of the federal poverty level (approximately \$35,000 per year for a family of four in 2017).

CHP+ covers children in families who earn too much to qualify for Medicaid but below 260 percent of the federal poverty level (about \$64,000 for a family of four).

⁸² Colorado Department of Health Care Policy & Financing, Data Analysis Section, Business Intelligence Data Management (BIDM) System. Note that these numbers do not match official Health Care Policy and Financing caseload numbers; they are much higher than those reported in caseload reports. Caseload reports include the number of clients eligible during any given month by eligibility categories. The percentages above are based on numbers that include all children with eligibility at any given time during the fiscal year.

The long-term impacts of Medicaid exposure in early Childhood: Evidence from the program's origin. *Journal of Health Economics* 45, pp. 161-175. As cited in Wagnerman, K., Chester, A., & Alker, J. (2017). Medicaid is a smart investment in children. Washington, DC: Georgetown University Health Policy Institute, Center for Children and Families.

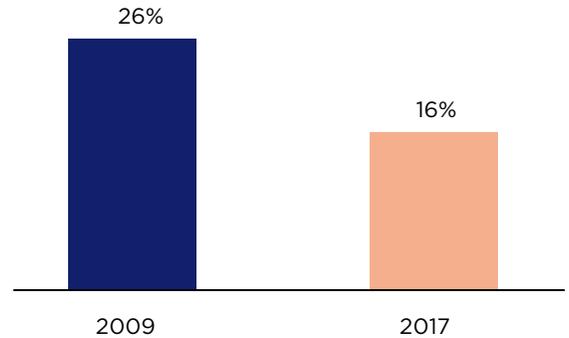

Access to Health Care

Having health insurance is a crucial first step in making sure children can access the health care they need. Although some families still face barriers such as a shortage of health care providers in their communities or a lack of affordable care, some indicators of health care access are improving.

The 2016 National Survey of Children’s Health found that children who were not insured at the time of the survey were nearly four times as likely to have gone at least 12 months without seeing a health care professional for a well child check-up, physical exam or other type of medical visit.⁸⁴ Clearly, health insurance coverage helps remove some barriers to the important health care services kids need, whether they’re in need of preventive services or acute care.

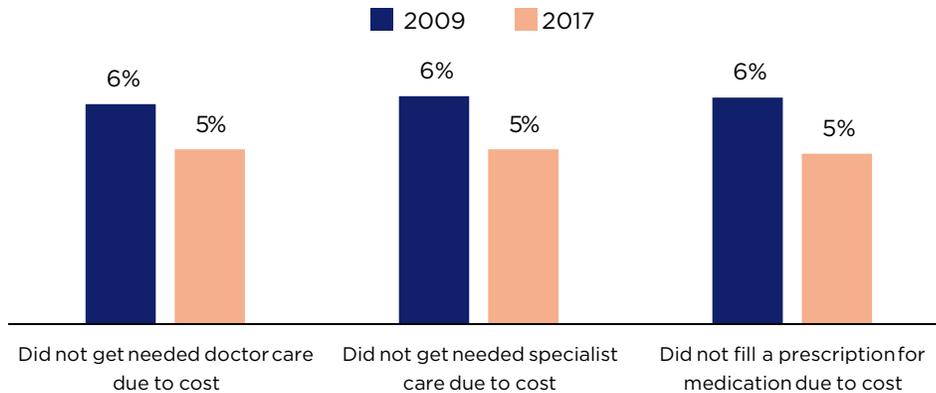

Data from the Colorado Health Access Survey show that, as the number of kids with health coverage has improved in recent years, fewer Colorado kids have parents who report problems paying medical bills. The percent of kids whose parents report cost as a barrier to accessing needed care has also dropped slightly.⁸⁵

Colorado Kids Whose Parents Reported Problems Paying or Inability to Pay Medical Bills

Source: Colorado Health Institute. 2009 and 2017 Colorado Health Access Surveys.

Colorado Kids Whose Parents Reported Cost as a Barrier to Needed Care for their Child

Source: Colorado Health Institute. 2009 and 2017 Colorado Health Access Surveys.

Access to care is more difficult to measure than access to health coverage, but some data sources highlight Colorado families’ experiences accessing care for their kids:

- In 2016, 82 percent of Colorado kids had a parent who reported that their child had visited a health care professional for a preventive care visit.
- Approximately 8 percent of Colorado kids had parents who reported they were told by a doctor’s office that they weren’t accepting their child’s form of insurance.

Immunizations

Immunizations are important tools for protecting kids from serious and once-common illnesses. They also help protect the health of our fellow community members who cannot be vaccinated for medical reasons, including newborn babies and those with compromised immune systems. However, data show that Colorado’s childhood immunization rates for some diseases sit below the 95 percent threshold required to protect the health of the general population.⁸⁶

As a result of a bill passed during the 2014 legislative session, Colorado launched a comprehensive new database in 2017 that provides immunization and exemption rates for nearly every Colorado school and school district, as well as for preschools, child care centers and Head Start programs serving more than 10 children. Data from the 2016-2017 school year show considerable differences in up-to-date immunization rates and exemption rates across the state’s school districts.

Immunization Rates by School District

HIGHEST EXEMPTION RATES

Moffat 2	25 percent
Pawnee	19 percent
Hinsdale County	17 percent

Food Security and Nutrition Support for Kids and Teens

In 2015, 14 percent of Colorado high school students reported that they went hungry at least sometimes due to a lack of food at home, and one in seven Colorado kids of all ages lived in households that experienced food insecurity between 2014 and 2016.^{87,88}

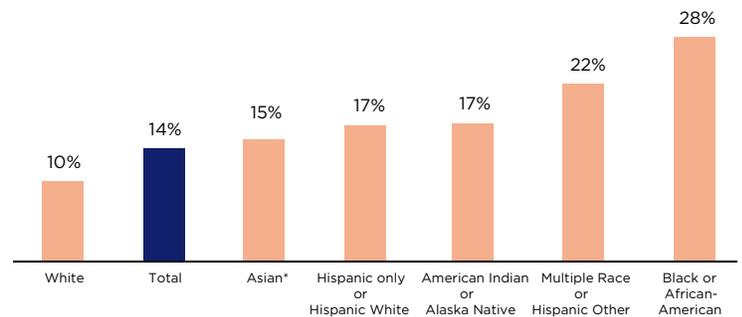

Kids need plenty of fresh, nutritious foods to support their growing bodies and brains. When kids fail to get enough food—or enough of the right kinds of food—their physical and cognitive development suffers. Food insecurity is also linked to obesity because it encourages overeating and because low-cost foods tend to be highly processed and less healthy. Young children are particularly vulnerable to food insecurity given the rapid pace of development during the early years of life, but research shows that older kids feel the detrimental effects of hunger as well:

- The need for energy and nutrients almost doubles from elementary school to high school, making it even harder to meet a child’s needs as they get older if they skip meals.⁸⁹
- Teens who experience hunger are more likely to have been suspended from school and have difficulty getting along with their peers.⁹⁰
- One study found that adolescents in families who reported they sometimes or often did not have enough food to eat were significantly more likely to have experienced depression and to have attempted suicide, even when controlling for family income.⁹¹

Children in Households that were Food Insecure at Some Point During the Year

Colorado has several nutrition programs designed to help support kids and families in accessing nutritious foods. Together, these programs serve hundreds of thousands of Colorado kids, but some families still face barriers to accessing the programs for which they qualify. Recent data show that only 76 percent of eligible Coloradans are enrolled in SNAP, and only 41 percent of all eligible women and children were enrolled in WIC.^{92,93} Further, because eligibility for these programs is restricted based on income, many Colorado families who experience food insecurity don't qualify for assistance. Feeding America found that 36 percent of food-insecure Coloradans have incomes too high to qualify for food assistance.⁹⁴

NUTRITION PROGRAMS BY THE NUMBERS:

101,278: Number of kids under 5 served by WIC in 2017.

232,981: Average kids per month served by SNAP in 2017.

379,202: Kids in preschool through 12th grade who qualified for free or reduced-price lunch at school.

101: Schools that serve free meals to all students using the Community Eligibility Provision, reaching 39,244 kids.

Substance Use Among Teens

The percent of Colorado adolescents who report using alcohol, cigarettes and some types of drugs has declined in recent years. Whether or not legalization of recreational marijuana for Colorado adults in 2013 has resulted in an increase in marijuana use among teens remains to be seen.

Substance use or abuse can lead to a number of harmful behaviors for children and teens. Alcohol and drug abuse is associated with driving under the influence, engaging in risky sexual behavior, and poor academic performance, among other problems. Abuse of drugs and alcohol during adolescence can also contribute to long-term physical or cognitive issues that persist into adulthood.

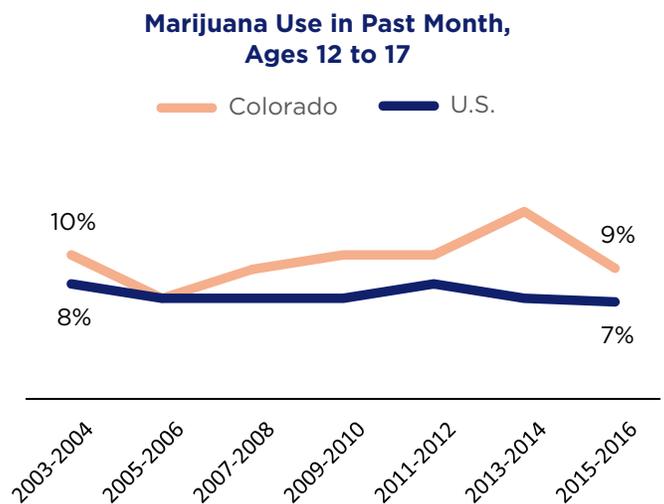

Colorado has seen sharp declines in the percent of teens who report using alcohol or cigarettes during the past month.⁹⁵

The long-term trend in marijuana use among Colorado teens is less clear.

Although the percent of Colorado teens who reported using marijuana in the past month appeared higher than the national average in 2015-2016, the difference between the two estimates was not statistically significant.

Compared to their peers across the country, however, Colorado teens are less likely to perceive smoking marijuana once a month as a risk. In 2015-2016, 18 percent of 12- to 17-year-olds in Colorado perceived smoking once a month to be a great risk, compared to 27 percent of U.S. teens.⁹⁶

⁹⁵ U.S. Department of Health and Human Services, National Survey of Drug Use and Health.

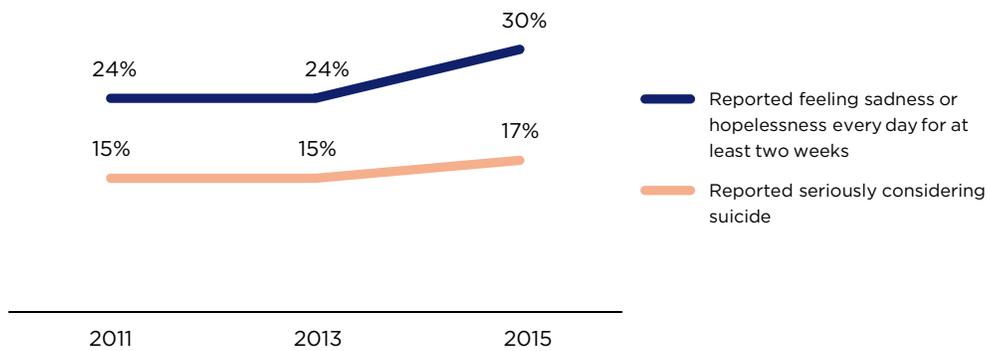

⁹⁶ *Ibid.*

Adolescent Mental Health

In 2015, nearly one in three Colorado high school students reported experiencing sadness or hopelessness that impacted their usual activities for at least two weeks—a hallmark symptom of clinical depression. This marks an increase from 2011, when one in four high school students reported experiencing this symptom.⁹⁷

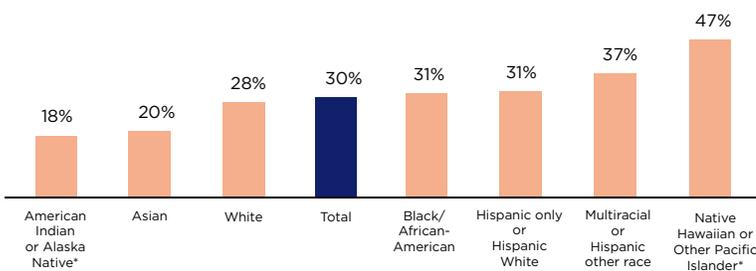

Across the U.S., it is estimated that 13 percent to 20 percent of all children experience a mental disorder in any given year.⁹⁸ Mental health challenges can affect kids of any age, and symptoms of mental illness often start in early childhood. However, many kids go without appropriate mental health treatment due to cost, a shortage of providers, stigma or other barriers.

Many Colorado high school students report mental health struggles.

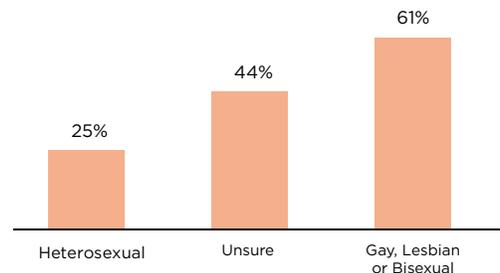

Although mental health challenges affect kids of all backgrounds, data show that some kids are at higher risk than others.

The Work Ahead: Teen Suicide Rates

The 1993 KIDS COUNT report highlighted a goal to reduce Colorado's youth suicide rate to no more than 3.5 suicides per 100,000 kids. As of 2016, Colorado's teen suicide rate for teens ages 15 to 19 stood five times higher than this target rate. Data show that 18 out of every 100,000 Colorado teens died by suicide in 2016—one of the highest teen suicide rates on record since 1991.⁹⁹

With treatment, many kids who experience mental health struggles can lead happy, healthy lives. Tragically, however, suicide has claimed the lives of far too many Colorado children and adolescents. Among youth and young adults ages 10 to 24 in Colorado, suicide is the leading cause of death.¹⁰⁰

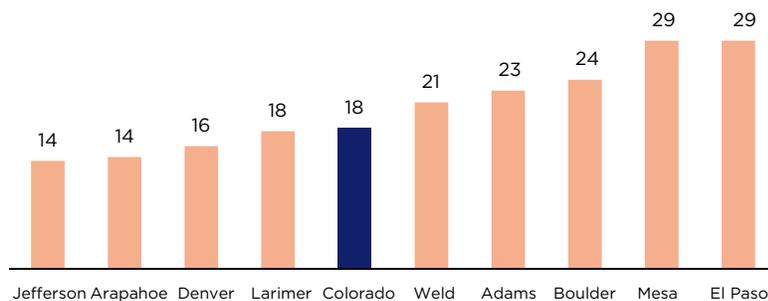

Teen Suicide Rate in Colorado
(rate per 100,000 teens ages 15 to 19), 1991 to 2016

In 2016, 66 Colorado teens died by suicide, up from 41 in 2012.

In order to protect the privacy of kids and families, Colorado does not report suicide rates for counties with fewer than three teen suicides per year. As a result, county-level data on suicides among teenagers are fairly limited. Among the nine large counties for which data were reported in 2016, teen suicide rates ranged from 14 per 100,000 in Jefferson County to 29 per 100,000 for El Paso and Mesa counties. Mesa County experienced a particularly high rate of teen suicides in 2016, but El Paso County has had a higher-than-average teen suicide rate for the past several years.¹⁰¹

2016 Teen Suicide Rates for Selected Large Counties
(rate per 100,000 teens ages 15 to 19)

Suicide Among Children and Youth: A Deeper Dive into a Tragic Trend

As youth suicide rates in many communities reach very high levels, examining the data more closely provides important context to help understand—and remedy—this trend.

What methods are responsible for the most suicides?

Hanging or suffocation were responsible for 46 percent of all suicides among kids ages 10 to 19 between 2012 and 2016, closely followed by firearms (41 percent).¹⁰² Unlike hanging or drug overdose, however, suicide attempts by firearm are almost always fatal. Those who attempt suicide with a firearm rarely survive. One study found that approximately 83 percent of suicide attempts using a firearm end in death, compared to less than 2 percent of suicide attempts by drug overdose. Evidence suggests that laws aimed at preventing children and youth from accessing firearms reduce firearm suicides among this age group.¹⁰³ Research also shows that the risk of suicides among kids and adolescents is lowest in families with no firearm in the home.¹⁰⁴

Suicides Among Colorado Youth Ages 10 to 19 by Method and Gender, 2012-2016

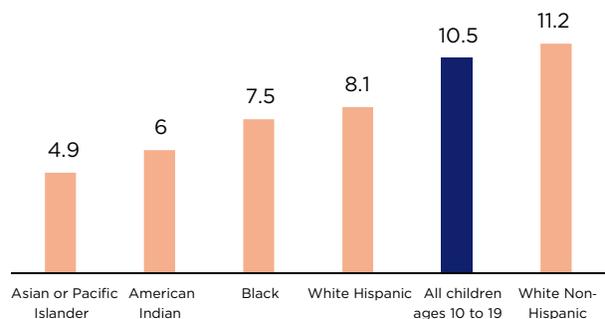

Suicide methods vary significantly by gender, with boys much more likely than girls to die by firearm suicide. Nearly half of all Colorado boys who died by suicide between 2012 and 2016 used a firearm, compared to 21 percent of girls. Suicide deaths by firearm were also more common among white children than among kids of other races and ethnicities.¹⁰⁵

Among which groups are suicides most prevalent?

Between 2012 and 2016, non-Hispanic white children and youth in Colorado had the highest suicide rate, at 11.2 per 100,000 youth ages 10 to 19. Suicides in this age group are also much more common among boys. Across Colorado, 244 boys died by suicide between 2012 and 2016, compared to 97 girls. As noted above, boys and non-Hispanic white youth are much more likely than other groups to use firearms as a suicide method, which are nearly always deadly.

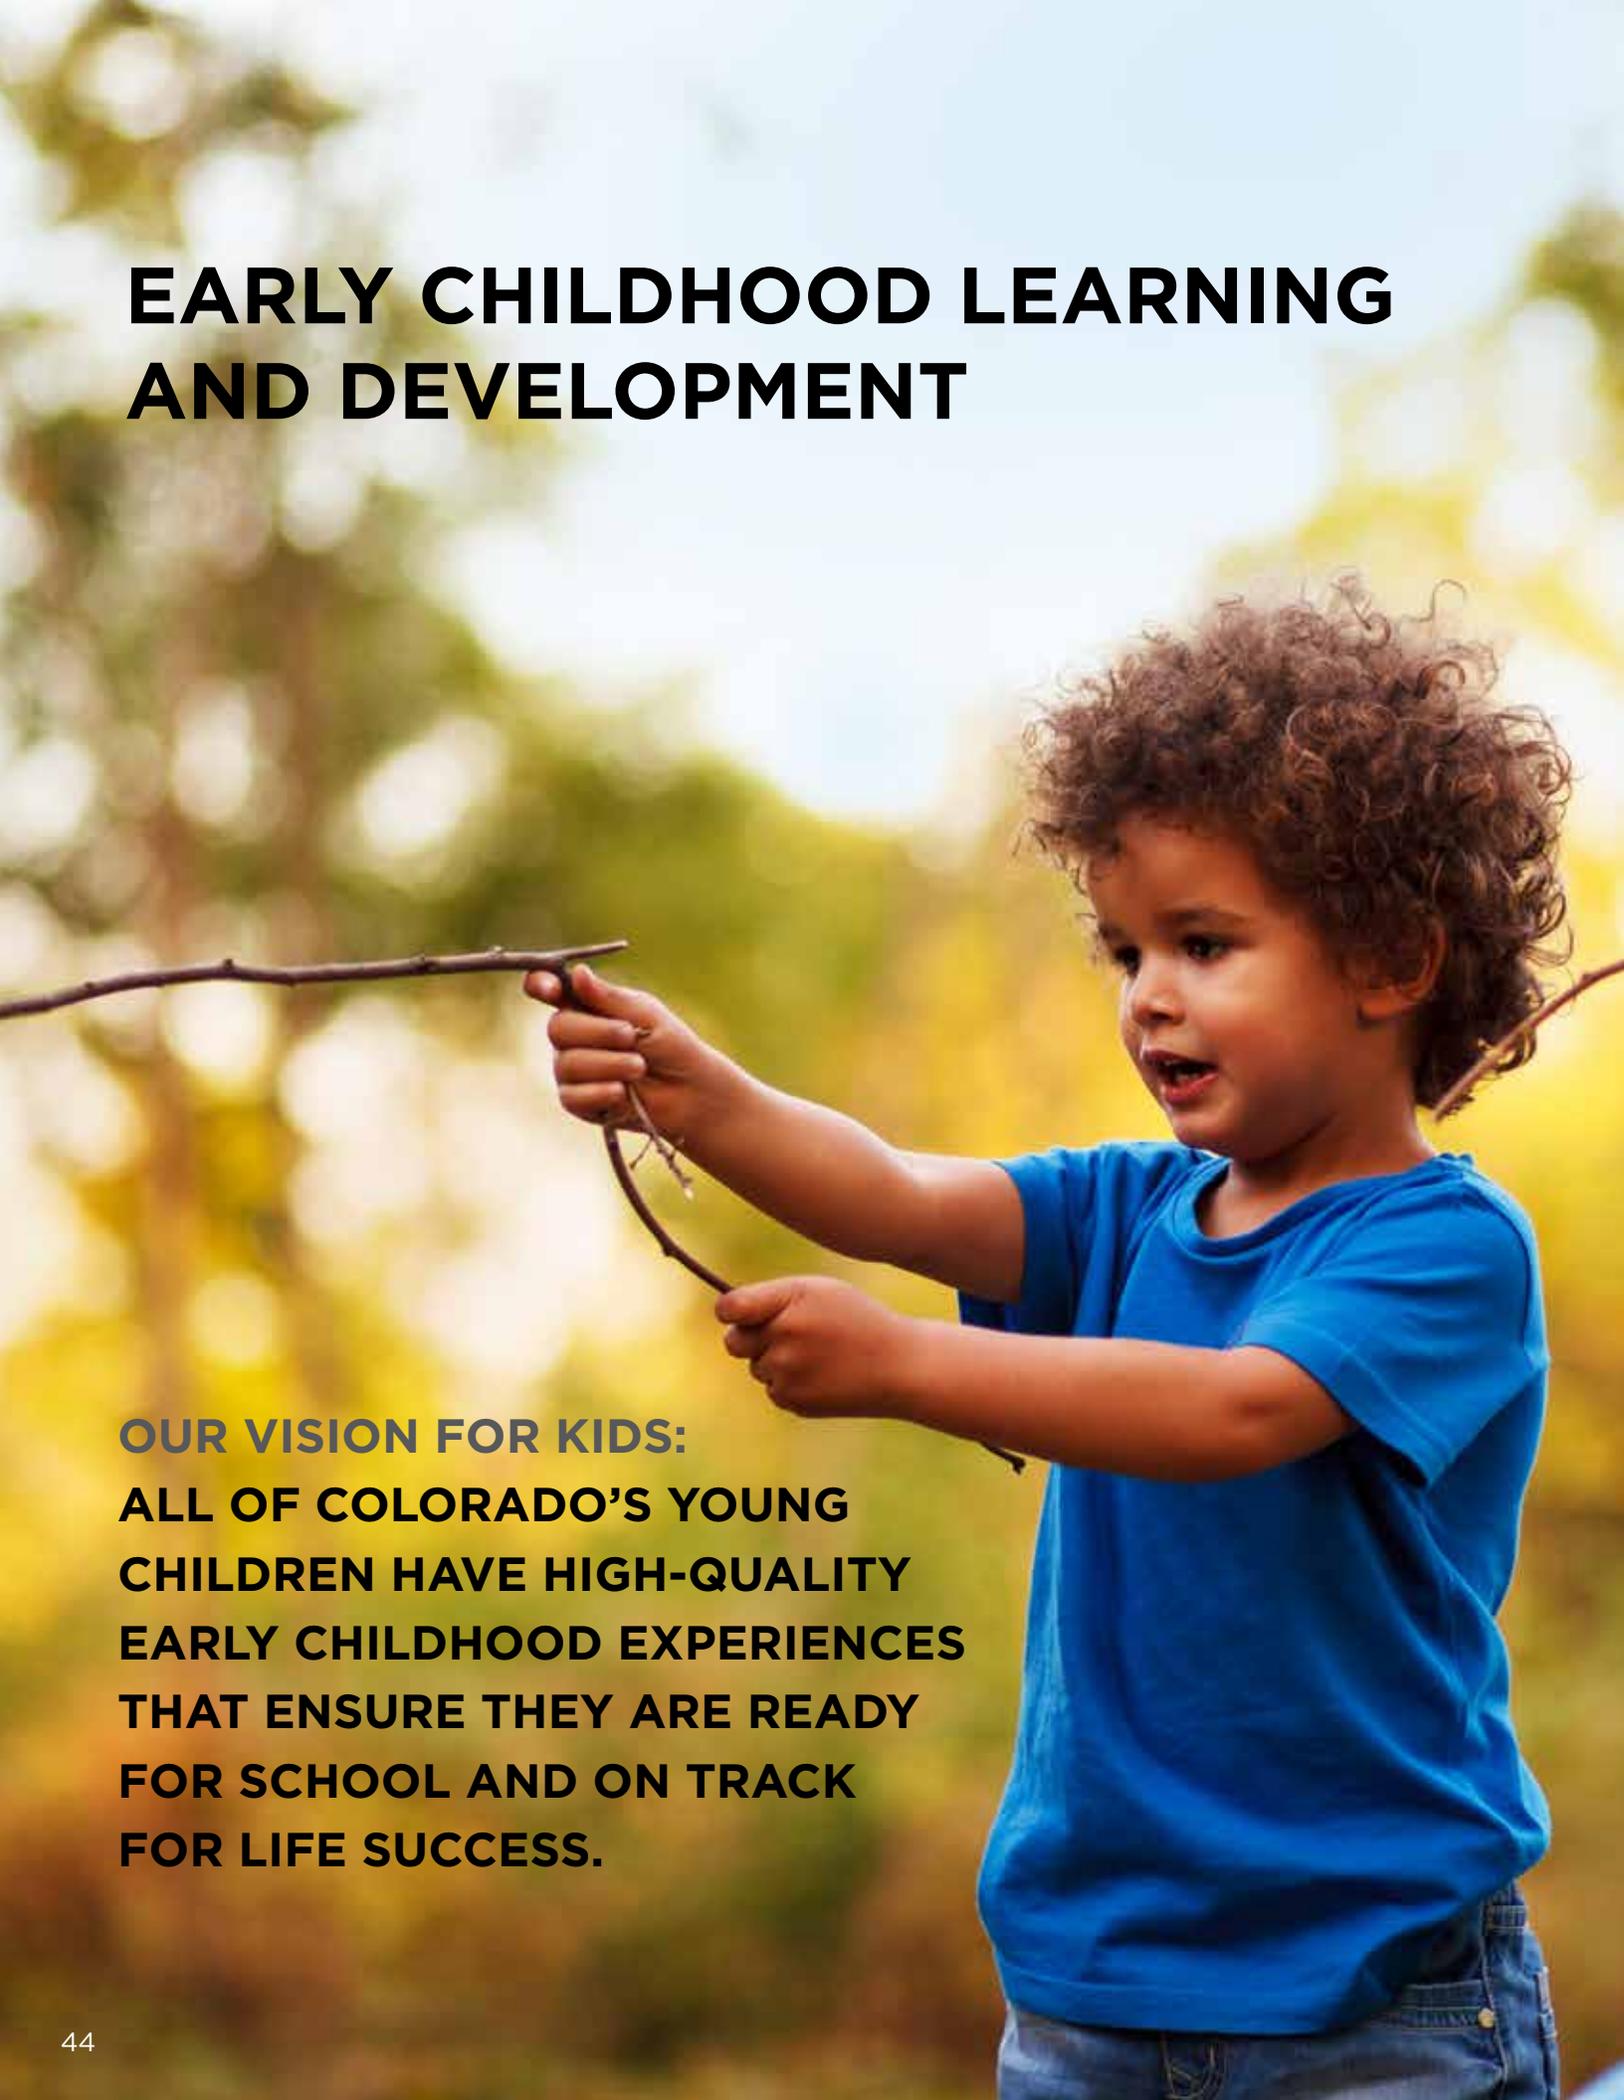

Suicide Rate for Colorado Youth Ages 10 to 19 by Race/Ethnicity, 2012-2016 (rate per 100,000)

Important data note: Suicide rates presented on the previous page are for Colorado teens ages 15 to 19. Information on this page includes data for kids and teens ages 10 to 19 to allow for data to be disaggregated in more detail. Suicide is generally rarer for kids ages 10 to 14 than for those ages 15 to 19; between 2012 and 2016, there were an estimated 75 suicides among 10- to 14-year-olds in Colorado, compared to 266 among 15- to 19-year-olds.

ALL OF COLORADO'S YOUNG
CHILDREN HAVE HIGH-QUALITY
EARLY CHILDHOOD EXPERIENCES
THAT ENSURE THEY ARE READY
FOR SCHOOL AND ON TRACK
FOR LIFE SUCCESS.**

Early Childhood Learning and Development

Availability of Child Care

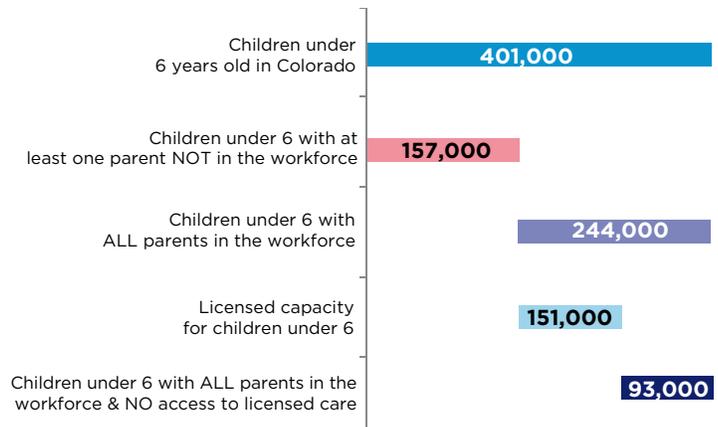

As of June 2016, licensed capacity in Colorado’s child care centers, family child care homes and preschools stood at about 151,000. That’s only enough to serve approximately 60 percent of the estimated 244,000 young children in Colorado who likely need child care while their parents work.^{106, 107, 108}

Child care helps keep Colorado’s economic engine running by ensuring that employers have a robust, stable workforce from which to draw talent. It also allows parents to earn an income to support their families. Given its importance to kids, families and our state’s economy, it’s critical that we ensure that high-quality, affordable child care is accessible to all Coloradans who need it.

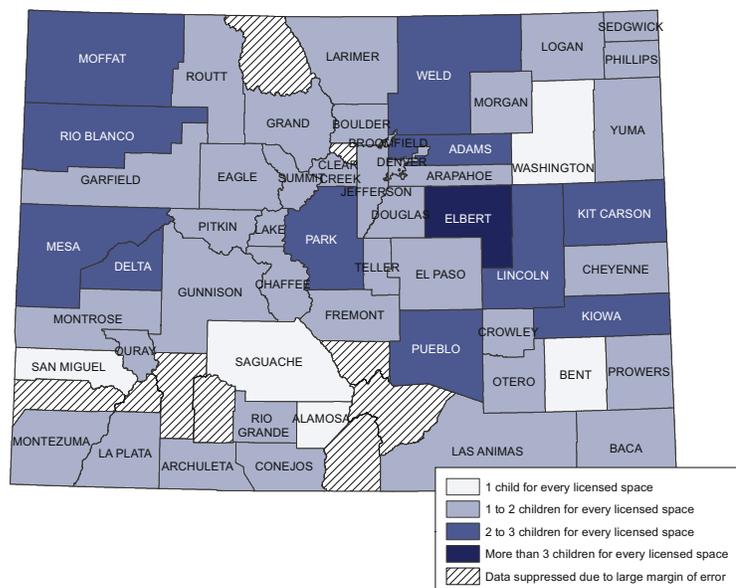

“Changing demographics over the past 35 years have made child care a fact of our modern lives.” This sentence appeared in the introduction to *KIDS COUNT in Colorado’s* first Early Care and Education section in 1995, but it remains just as relevant almost 25 years later. With nearly two out of three Colorado kids under the age of 6 living in families where all available parents are in the labor force, child care is an absolute necessity for most families in our state. For many Colorado parents, a shortage of stable child care creates significant barriers to the workforce. In 2016, 11 percent of Colorado kids ages 1 through 8 had parents who reported having to quit a job, not take a job, or greatly change their job because of problems with child care.¹⁰⁹

Across Colorado, the struggle to find stable child care weighs on parents’ minds. In many communities—both urban and rural—the estimated number of children who need care exceeds licensed capacity in child care centers, family child care homes and preschools. In Adams County, for example, there were an estimated 2.6 children in need of care for every licensed slot. Elbert County had the highest ratio of children to licensed capacity, with more than 3.4 children in need of care for each slot.^{110, 111} Note that data used to create the adjacent graph reflect total licensed capacity for all children under 6; care for some age groups, particularly infants, is even more limited in many communities.

Where are Colorado’s children under 6 spending their days?

Children Under 6 in Need of Child Care Compared to Licensed Capacity

Progress for Kids: Promoting Quality in Colorado's Child Care Programs

KIDS COUNT's first Early Care and Education section noted that the vast majority of Colorado child care programs were not able to offer the high quality of care they know children deserve.¹¹² Although quality ratings from the 1990s are not comparable to more recent child care quality ratings, many of Colorado's child care programs are pursuing higher levels of quality, according to initial data from the state's recently implemented quality rating and improvement system, Colorado Shines.

Colorado recently implemented a quality rating and improvement system (often referred to as QRIS) to help promote quality in child care programs across the state. The system, known as Colorado Shines, is embedded in Colorado's child care licensing system and assigns quality ratings to programs serving children who have yet to enter kindergarten. Child care programs can earn quality ratings ranging from Level 1 through 5, with Level 5 reflecting the highest level of quality. All licensed programs automatically receive a Level 1 rating, and programs can pursue higher ratings by completing additional activities and meeting indicators of quality in five areas: workforce qualifications and professional development; family partnerships; leadership, management and administration; learning environment; and child health. Specific criteria within these categories include qualifications of directors and teaching staff, staff-to-child ratios and engagement of families and communities, among others.¹¹³ As of January 2018, 22 percent of all programs were rated as high-quality, reflecting 40 percent of all licensed capacity.¹¹⁴

In January 2017, capacity in Colorado's high-quality child care centers, family child care homes and preschool programs made up **31 percent** of total licensed capacity. By January 2018, that percentage had risen to **40 percent**.

Colorado Child Care Programs by Quality Rating*

*Ratings as of January 2018. Levels 3, 4 and 5 are considered high-quality.

Why Quality Matters

High-quality child care settings create lasting positive effects for children, boosting cognitive skills such as math and language abilities, as well as social skills. Poor-quality environments, however, can actually harm kids' development. Children whose mothers have lower educational attainment, a risk factor that affects school readiness, are particularly sensitive to the effects of child care quality. One study found they experience more benefits from high-quality child care and more harm from child care that is low in quality.

¹¹⁴ Colorado Department of Human Services, Office of Early Childhood. Colorado Licensed Child Care Facilities Report: January 2018. Calculations performed by the Colorado Children's Campaign.

Affordability of Child Care

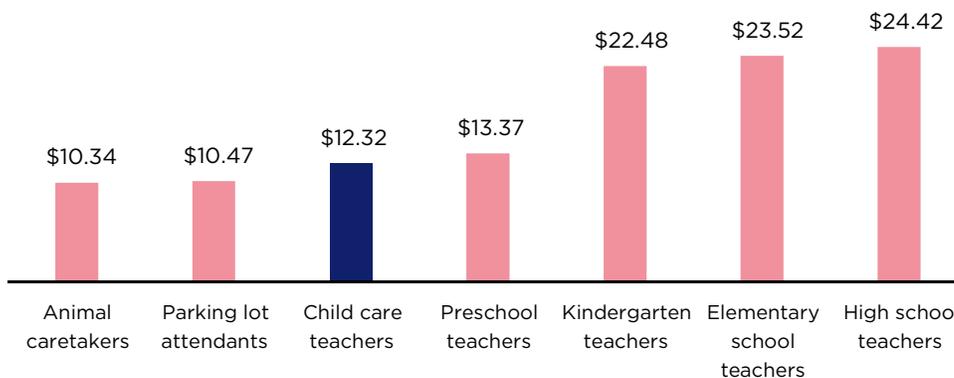

All of us benefit when families can access affordable, high-quality child care. Employers benefit from reduced employee turnover and lower rates of absenteeism. Parents benefit from knowing their children are safe and cared for while they work to support their families. And children reap benefits from positive, nurturing relationships with stable child care providers. Removing barriers to affordable child care is one of the best two-generation strategies Colorado can employ to promote positive outcomes for parents and their children.

Although child care is a basic necessity for most Colorado families, it is also a significant expense. For many working families, child care expenses may be more than their budgets can bear. Child Care Aware reports that center-based care for an infant in Colorado cost \$15,138 per year, on average, in 2017.¹¹⁵ A family earning Colorado’s median income for families with children would need to spend nearly 20 percent of their pre-tax income on child care for one infant. For a two-parent family with two children living at 100 percent of the federal poverty level, this expense would eat up more than 60 percent of their pre-tax income.¹¹⁶

Although child care is unaffordable for many families, decreasing the cost of care is not the answer to the challenges Coloradans face in accessing child care that is affordable. Many important features of high-quality child care, such as small group sizes, low child-to-staff ratios and qualified, experienced staff, cost a lot to provide. And despite the high costs families pay for child care, most child care programs operate on very thin margins. Given research showing that low-quality child care can in fact *harm* children’s development, sacrificing quality for cost will not benefit Colorado in the long run.

In the vast majority of child care programs, staff salaries and wages make up the largest share of the budget. Studies have found that caregiver education and turnover are closely associated with quality of care; yet, wages for child care providers are very low relative to many other occupations.¹¹⁷ In Colorado, for example, child care teachers made significantly less in 2016 than kindergarten teachers, elementary school teachers and high school teachers—and in fact, only slightly more than parking lot attendants and animal caretakers.¹¹⁸ Low wages for child care providers contribute to high turnover in the profession, which hurts the quality of care children receive. The Colorado Early Childhood Workforce Survey found that low pay led preschool teachers to leave their jobs four times more often than elementary school teachers.¹¹⁹ Cutting wages that are already very low in order to reduce costs would further constrain child care providers’ abilities to recruit and retain talented staff and would result in a level of care much lower than what our state’s kids deserve.

Median Hourly Compensation for Selected Occupations in Colorado, 2016

Colorado Child Care Assistance Program (CCCAP): Participation and Eligibility

Public programs like the Colorado Child Care Assistance Program (CCCAP) help make care more affordable for low-income families without sacrificing quality. In fiscal year 2016-2017, 30,328 Colorado kids accessed child care with support from CCCAP at some point during the year.¹²⁰

CCCAP is a voluntary program that provides a subsidy for a portion of child care costs to child care providers who contract with the program. Specific eligibility requirements for CCCAP vary by county, but in general, parents are required to be working, searching for employment, in workforce training or enrolled in the Colorado Works program, and must also meet income eligibility requirements. Counties may determine their own income eligibility levels, but may not set eligibility lower than 165 percent of the federal poverty level or above 85 percent of state median income.

CCCAP BY THE NUMBERS:

30,328: The number of **children who were supported by CCCAP** at any point during fiscal year 2016-2017.

13 percent: The share of **eligible children who received child care subsidies** through the program in 2016-2017.

7: The average number of months that kids receiving child care subsidies received **continuous, uninterrupted care**.

112: The average number of **days children and families spent on a waitlist** for CCCAP, as of November 1, 2017.

1,616: The number of **cases closed in fiscal year 2016-2017 as a result of family income exceeding eligibility requirements**.

45 percent: The percent of **children receiving child care assistance in a high-quality setting** as of December 2016, up from only 26 percent in December 2013.

The Lasting Impact of Adverse Childhood Experiences

Since the release of the first KIDS COUNT report in 1993, much has been learned about child brain development and the impact of significant adversity during childhood—particularly during the earliest years when young brains are in a sensitive and important period of development.

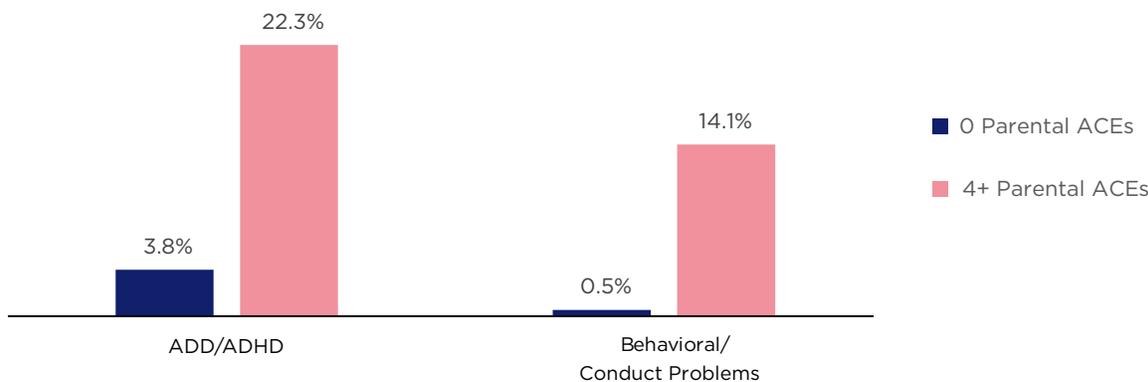

The first few years of life are an incredible time for a child’s development. Between birth and 3 years old, children are forming more than *one million* new neural connections *every single second*.¹²¹ These connections will serve as the building blocks for skills children will use throughout their lifetimes. Nurturing environments during these early years are critical for healthy development and a strong start. When children experience trauma or adversity during their earliest years, however, the stress associated with traumatic events can be toxic to their developing brains unless they receive adequate support from adults around them.

The Adverse Childhood Experiences Study: A landmark study published in 1998 and conducted by the Centers for Disease Control and Kaiser Permanente found that experiencing multiple types of adversity during childhood is associated with higher risk of both physical and mental health issues, including heart disease, diabetes, obesity and depression. Adults who had been exposed to adverse childhood experiences (ACEs), including domestic violence, parental substance abuse, divorce or death of a parent, or economic hardship, were significantly more likely to be affected by heart disease, diabetes, obesity and depression.¹²² **In 2016, nearly 16 percent of Colorado kids under the age of 6 had already been exposed to two or more adverse experiences; among all Colorado kids under age 18, the proportion rises to 22 percent.**¹²³

The effects of childhood adversity do not stop with the child who experiences it. A recent analysis of Colorado data found that the harmful impacts of ACEs can persist across generations.

In Colorado, parents who reported that they themselves had experienced four or more adverse childhood experiences were nearly four times more likely to report that their *child* needs mental health services than parents who experienced no ACEs. Parents with at least four ACEs also reported higher prevalence of diagnoses of ADD/ADHD and behavioral or conduct problems among their children.¹²⁴

Head Start and Early Head Start

In 2016, Head Start and Early Head Start served nearly 14,000 young children and expectant moms across the state, almost double the number served in 1991.¹²⁵

Head Start, which serves children ages 3 to 5 years old, and Early Head Start, which serves pregnant women and children from birth to age 3, promote healthy physical, cognitive and social development and boost school readiness among young children experiencing poverty. In addition to providing early learning opportunities, the programs also offer health and social services for families who want them. Depending on each family's needs, Early Head Start and Head Start can help families find a medical home, connect them to health insurance for their child, and provide screenings for developmental, sensory, behavioral, hearing or vision problems.¹²⁶

Between 1991 and 2016, the number of children and pregnant women served by Early Head Start or Head Start in Colorado nearly doubled.

Although the number of kids and pregnant women served by Early Head Start and Head Start has steadily increased in the past 25 years, the number of children who qualify still far exceeds the program's capacity. The number of available slots is limited by funding, which is authorized by the U.S. Congress.

Despite an increase in the number of slots, Head Start and Early Head Start still only served one in every four of Colorado's young children in poverty in 2016.

Progress for Kids: Colorado Preschool Program

When the 1993 KIDS COUNT report was released, the Colorado Preschool Program was only five years old and served a fraction of the children it serves today. In the 1991-1992 school year, the Colorado legislature authorized 2,719 Colorado Preschool Program (CPP) slots. By the 2016-2017 school year, the number of authorized slots had climbed to 28,360. While this increase marks progress for Colorado kids, the number of slots authorized in 2016-2017 is still not enough to meet the needs of all young children in Colorado who could benefit from the program’s positive impact on school readiness.¹²⁷

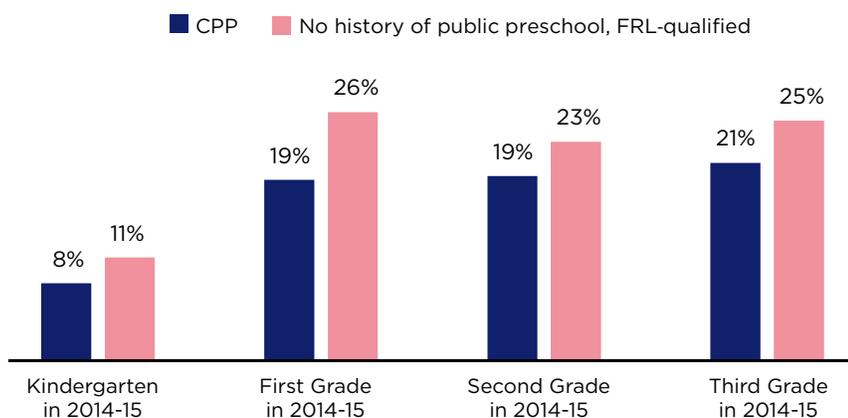

Created in 1988, the Colorado Preschool Program is Colorado’s state-funded, voluntary preschool program for 3- and 4-year-old children, as well as 5-year-olds not currently in kindergarten. The program initially focused only on children in need of language development, but the set of risk factors under which children can qualify for CPP has since been broadened to include other barriers to school readiness. Each CPP slot includes a 2.5-hour day of preschool, four days per week, with the fifth day usually set aside for teacher professional development and family outreach activities.

In the 2016-2017 school year, CPP served **24 percent of all 4-year-olds** in the state. The 2,719 slots available in 1991-1992 were only enough to serve approximately **4 percent of Colorado 4-year-olds**.

Data from the Colorado Department of Education point to CPP’s effectiveness at boosting school readiness and improving other academic outcomes among children who participate.

By the end of the school year, children who participate in CPP make significant gains in several domains of school readiness, including social-emotional, language and cognitive skills. Beyond the preschool year, children who participate in the Colorado Preschool Program are, on average, less likely to have a significant reading deficiency in the early grades; less likely to be retained (held back) in the early grades; and more likely to meet or exceed expectations in core subjects—in some subjects, as far out as 11th grade.¹²⁸

Students Identified with Significant Reading Deficiencies by Preschool Participation

The Power of Preschool: An Update on Perry Preschool Project Participants

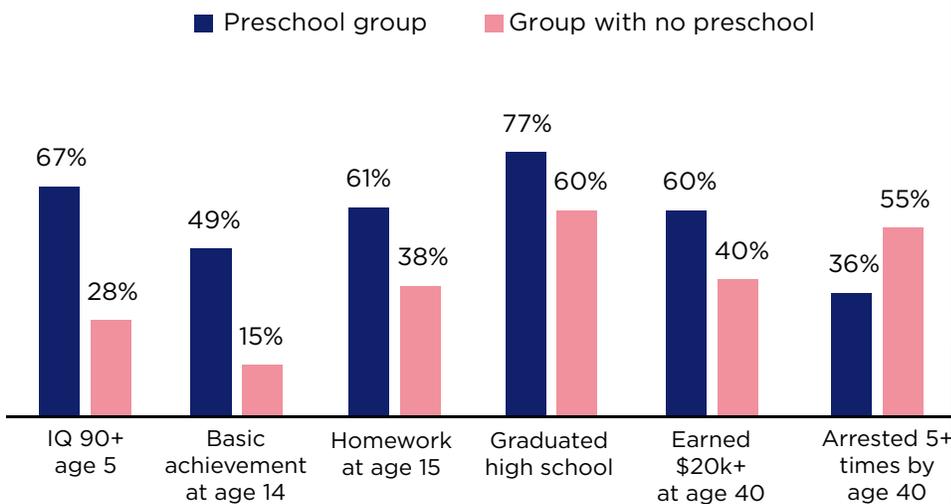

High-quality preschool programs help ensure kids start kindergarten with the skills they need to hit the ground running in school—but the positive effects of high-quality preschool don’t expire during childhood. Decades of research show that participation in a high-quality preschool program can alter the trajectory of a child’s life, with benefits experienced for decades to come.

The Perry Preschool Project is one of the most well-known, long-term studies of the effects of preschool participation on children’s lives. The study began in the early 1960s when preschoolers facing barriers to school readiness were randomly assigned to two groups: one group would receive two years of high-quality preschool instruction, while the other group received no preschool. Researchers collected data on participants’ educational progress during and immediately after their preschool years and continued to follow them later in life, collecting data at ages 14, 15, 19, 27 and 40.

When *KIDS COUNT in Colorado’s* first Early Care and Education section highlighted the participants’ life outcomes at age 27, the report noted that for every dollar invested in preschool for the Perry Project participants, an estimated \$7.16 was returned to society in income, payroll taxes and reduced social costs. Researchers have continued to follow the participants in the years since. A 2005 update on the preschool participants found that the return to society was even higher by the time the participants reached age 40: for every dollar invested, society saw a return of \$12.90.¹²⁹

The program yielded benefits beyond the education system; in addition to being more likely to graduate high school, participants were more likely to be employed at age 40, more likely to own a home or a car and significantly *less* likely to have been arrested for a crime.¹³⁰

Perry Preschool Project Participants at Age 40

Kindergarten School Readiness in Colorado

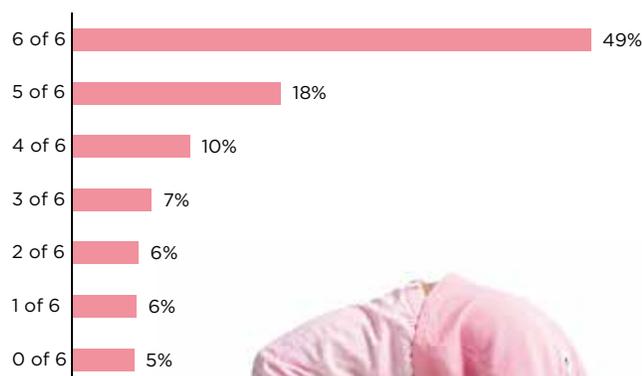

How many of Colorado’s kindergartners enter school ready to learn? Until recently, Coloradans lacked a comprehensive answer to what may seem like a simple question. In 2018, the state released long-awaited data from recently implemented school readiness assessments. The results show that slightly fewer than half of all Colorado kindergartners meet all six domains of school readiness.¹³¹

Using one of four school readiness assessments approved by the State Board of Education, Colorado teachers assess kindergartners’ school readiness across six domains:

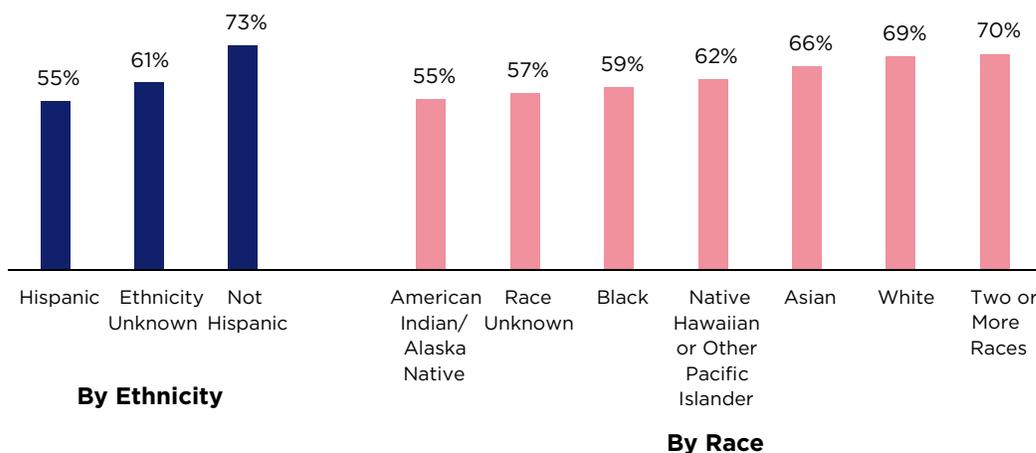

- Physical well-being and motor development
- Social and emotional development
- Language and comprehension development
- Cognition
- General knowledge in math
- General knowledge in literacy

Results from school readiness assessments show that kindergarten readiness varies by race and ethnicity. Research has long shown that children of color face more educational barriers than their white peers, including more limited access to high-quality preschool programs. Data from school readiness assessments show that Colorado has more work to do to ensure that our state’s children of color are equipped with the basic skills they need to be successful right from the start.

Colorado Kindergartners Meeting School Readiness Domains, 2017-2018

Colorado Kindergartners Meeting At Least 5 Out of 6 School Readiness Domains by Race/Ethnicity

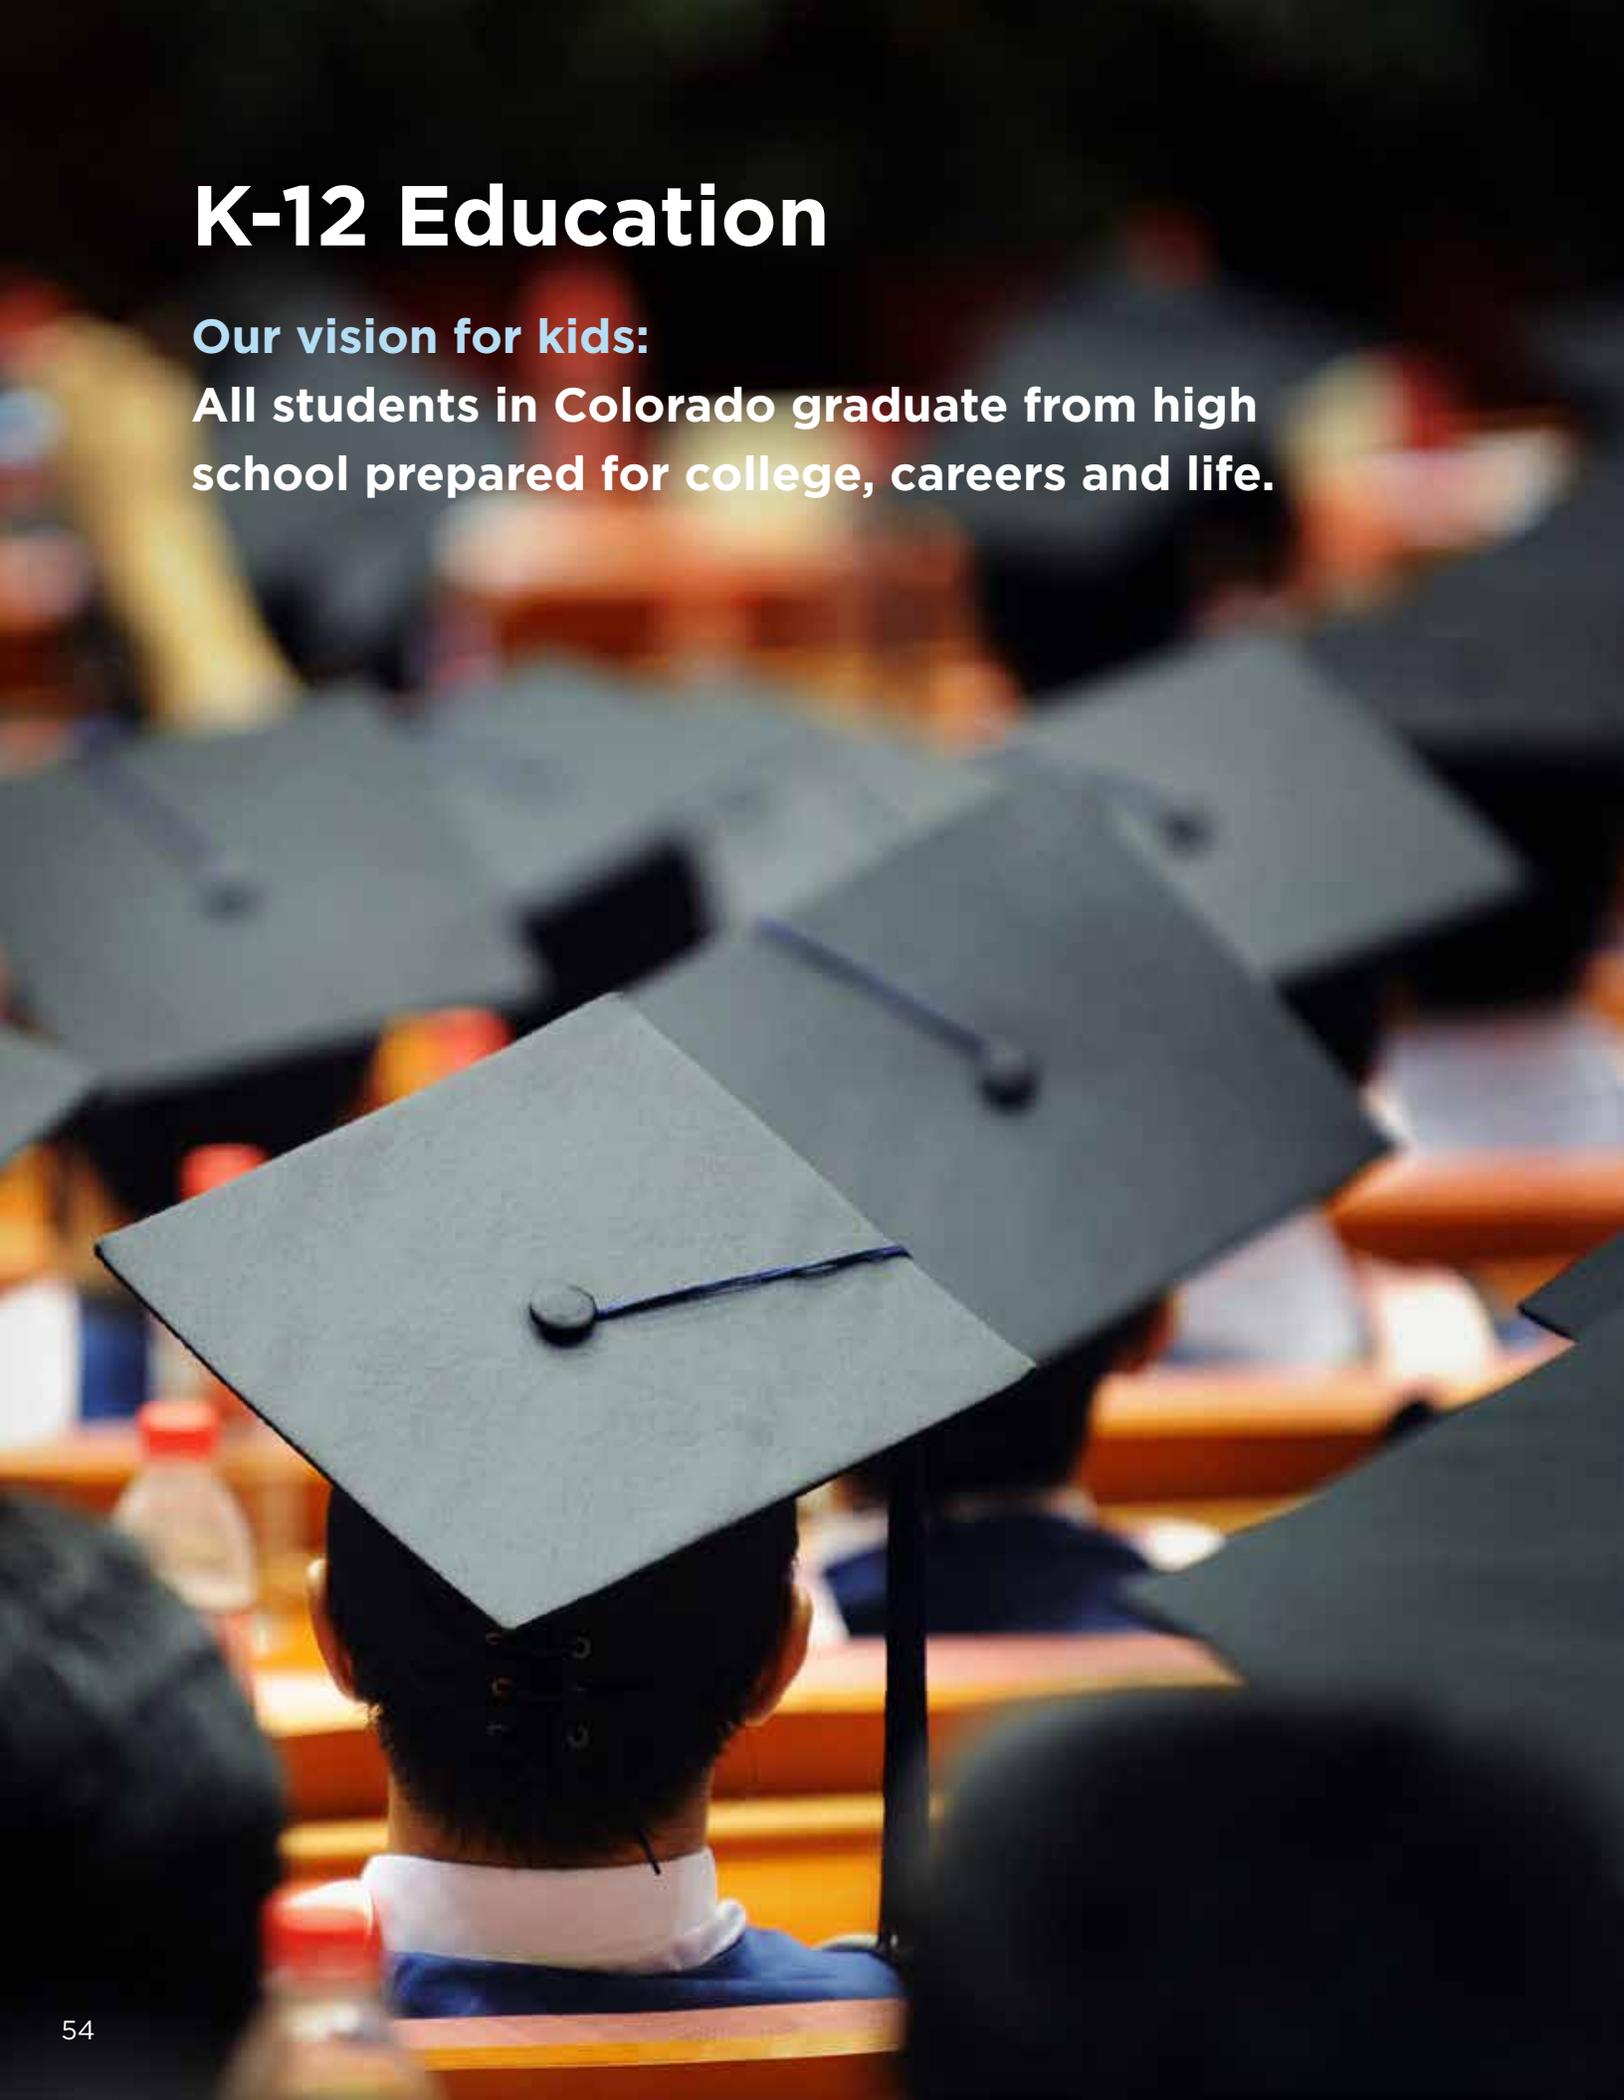

Although these new data are a step in the right direction, decisions about how the data are reported have limited the public’s ability to identify the specific areas in which children struggle. For example, from the existing data, it’s impossible to know whether Colorado’s kindergartners are more likely to struggle with language comprehension or with their motor development and physical well-being. In order to appropriately target efforts to improve school readiness, the state must provide more detailed data regarding kids’ readiness for kindergarten.

¹³¹ Colorado Department of Education. (2018). Colorado’s Achievement Plan for Kids (CAP4K) 2018 Annual Legislative Report.

K-12 Education

Our vision for kids:

All students in Colorado graduate from high school prepared for college, careers and life.

Enrollment in Colorado's Public Schools

**1992:
612,635**

**2017:
910,280**

**Low:
1992**

**Peak:
2017**

In the 1992-93 school year, Colorado schools educated 612,635 students in grades PK-12. Twenty-five years later, the number of kids attending Colorado public schools has grown by nearly 50 percent, reaching 910,280 students in 2017-18.¹³²

Colorado students are a more diverse group today than they were 25 years ago. In 1992-93, kids of color made up 26 percent of Colorado students; by 2017-18, students of color represented 47 percent of all public school students in the state. Non-Hispanic white kids remain the majority among Colorado's student population (53 percent of all students in 2017-18), followed by Hispanic/Latino children (34 percent of students). Latino and Asian students saw the fastest growth between the 1992-93 and 2017-18 school years.¹³³

COLORADO STUDENTS BY NUMBERS:

In the 2017-18 school year...

379,202 students **qualify for free or reduced-price lunch** (42 percent of all students)

128,274 students were **identified as English Language Learners** (14 percent of all students)

98,984 students **receive special education services** (11 percent of all students)

67,082 students **participate in gifted and talented programs** (7 percent of all students)

11,657 students are **immigrants** (1 percent of all students)

The Work Ahead: Creating an Equitable School Funding System for the 21st Century

As noted throughout this report, much about Colorado kids, families and communities has changed since the early 1990s. One thing that hasn't changed in nearly 25 years? Colorado's system for funding its schools.

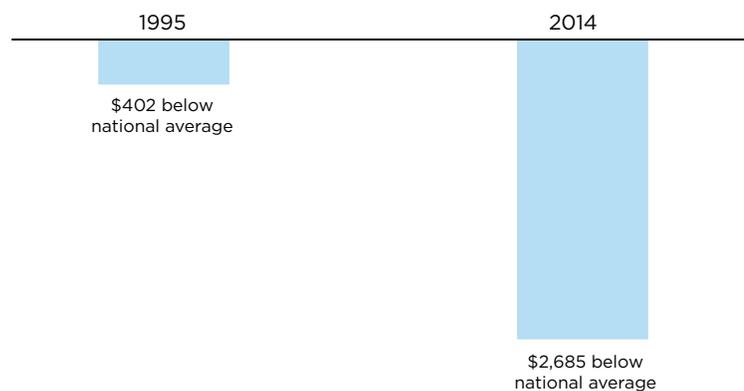

Next year will mark a quarter of a century since Colorado has made meaningful updates to the way we fund our schools. The formula Colorado currently uses to allocate funding to each school district is based on legislation crafted in 1994, meaning investments are not strategically targeted to meet the diverse and changing needs of Colorado's students or the workforce they will enter.

Our outdated school finance formula determines how our education dollars are distributed around the state. How many dollars are dedicated to education overall is another story. The last few decades have seen Colorado's school funding fall significantly behind the national average. Conflicting tax policies amended into our state constitution limit the amount of funding available for our schools, shortchanging our state's students, teachers and communities.

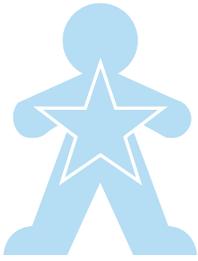

In 1995, the earliest year for which comprehensive data are available, Colorado's per-pupil funding sat approximately \$402 below the national average, after adjusting for regional differences in the cost of living. By 2014, the gap between what Colorado was spending on each student and the national average had grown to nearly *\$2,700 per pupil*. Consider this shortfall on a larger scale: multiplied by 25 kids in a classroom, that \$2,700 gap represents more than *\$67,000 per classroom* that Colorado schools would receive if our state's per-pupil funding were on par with the national average.¹³⁴ Only nine states spend less per pupil than Colorado.

It takes more than funding to create a great school—but without adequate funding, it is nearly impossible for schools to afford the things all of our students deserve: resources such as dedicated and skilled teachers, engaging classroom materials, school counselors and social workers, or music and art classes. In the years to come, it's essential that we work to bring our state's system for funding schools into the 21st century so that all of Colorado's bright young students can reach their full potential.

A Growing Gap: Difference in Per-Pupil Spending Between U.S. and Colorado Adjusted for Regional Cost Differences

¹³⁴ National Center for Education Statistics. Revenues and expenditures for public elementary and secondary education accessed through <http://www.edcounts.org/createtable/step1.php>. As reported in the KIDS COUNT Data Center.

Progress for Kids: Growing Availability of Full-Day Kindergarten Programs

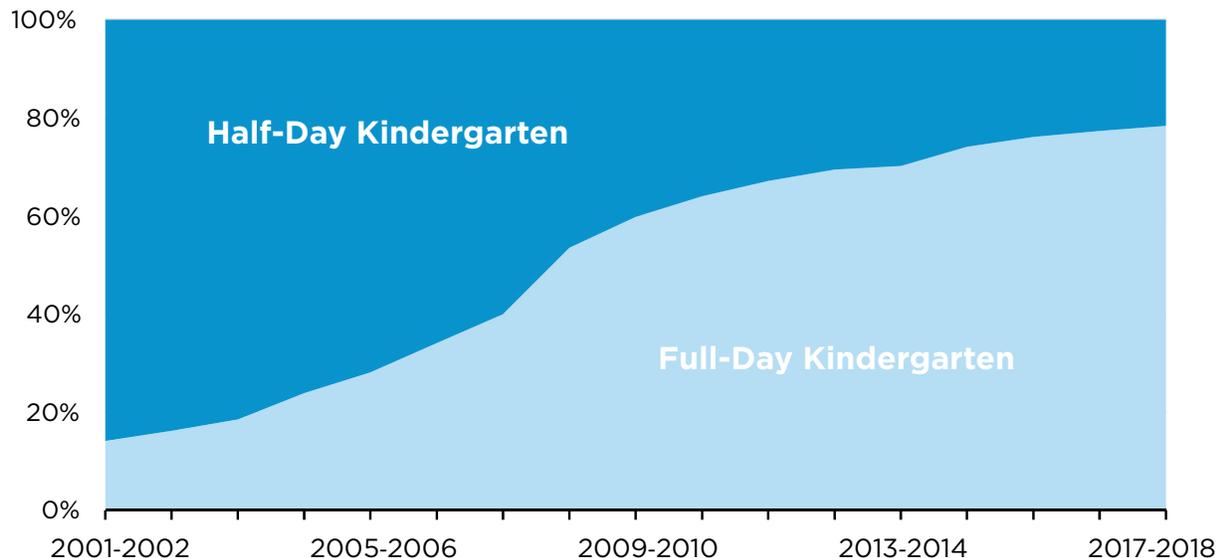

Although state-level data on full-day kindergarten only go back 16 years, they show incredible progress toward enrolling more kids in full-day programs. The growing number of kids enrolled in full-day programs has occurred despite the fact that the state currently only funds a little over a half day for Colorado kindergartners.

Attending a full day of kindergarten helps young learners build a strong foundation for academic success. Research has consistently highlighted the many benefits of participation in a full-day kindergarten program, including improved student attendance during kindergarten, lower rates of grade retention later in a child’s schooling, and larger gains in reading and math relative to children enrolled in half-day programs.^{135, 136, 137}

Between the fall of 2001 (the earliest year data are available) and fall of 2017, the share of Colorado kindergartners enrolled in a full-day program climbed sharply. In the 2017-2018 school year, 78 percent of Colorado kindergartners were enrolled in a full-day program—up from only 14 percent in 2001-2002.¹³⁸

Because the state only provides districts with enough funding to provide a little more than a half day of kindergarten, districts that want to offer a full-day program must either charge parents tuition for the second portion of the day or identify a local funding source, such as a local bond or mill levy. Recently, school districts have committed to full-day kindergarten despite the gap in state funding; in 2017-2018, 173 out of Colorado’s 178 school districts, plus the Charter School Institute, had at least a portion of their kindergartners enrolled in a full-day program. In 140 school districts, all kindergartners attended a full-day program.¹³⁹

Chronic Absenteeism

Nearly one in six Colorado students was absent from school for at least 15 days during the 2013-14 school year, according to the most recent data available.¹⁴⁰

Students who miss at least three weeks of school for any reason are considered “chronically absent” and are at risk of falling behind. Studies have linked chronic absenteeism to lower student achievement, fewer literacy skills, higher rates of grade retention and increased likelihood of dropping out of high school.¹⁴¹ Some research has even found that chronic absenteeism is more powerful than test scores at predicting whether or not a student will graduate from high school.¹⁴²

While in-school factors such as bullying, school culture and student-teacher interactions can contribute to chronic absenteeism, family income is consistently shown to be one of the strongest predictors of whether a student will be chronically absent. A Utah study found that a student who qualified for free or reduced-price lunch was nearly *twice* as likely as his or her peers to be chronically absent. Students experiencing homelessness were two and a half times more likely to be chronically absent than other children.¹⁴³ Poverty and economic instability present unique barriers to school attendance; unreliable transportation, non-traditional parental work schedules, limited access to health care to manage chronic conditions and even a lack of clean clothes or weather-appropriate shoes can all limit kids’ abilities to be at school each day.¹⁴⁴ Students of color, who are more likely to experience poverty and other barriers to educational opportunity, are also more likely to be chronically absent than their white peers.¹⁴⁵ Of the 10 Colorado school districts with the highest rates of chronic absenteeism in 2013-14, all but one served higher-than-average percentages of students from low-income families. All but two had student populations that were at least two-thirds students of color.¹⁴⁶

Students Who Were Chronically Absent by Race/Ethnicity, 2013-14

Ensuring Every Colorado Child Has a High-Quality Teacher

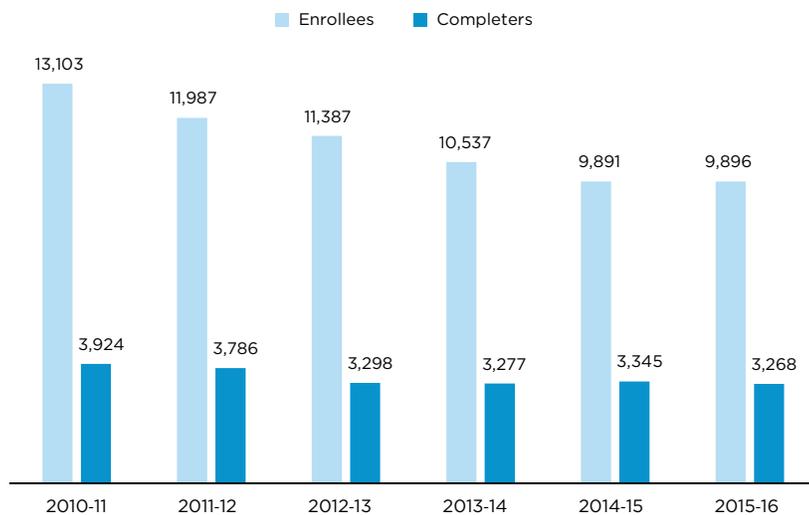

Every day, in classrooms across the state, incredible teachers are making a difference in the lives of kids. Offering a word of encouragement, providing a listening ear for a student having a tough day, helping kids experience an “aha!” moment when they solve a tough math problem for the first time—teachers from Craig to Colorado Springs work in countless ways to help students reach their full potential.

Recruiting and retaining high-quality, committed teachers is one of the best investments Colorado can make in our children. Research has shown teachers to be the *most* important in-school factor for student achievement.^{147, 148} However, many schools and districts across the state are feeling the effects of a teacher shortage and having a difficult time finding and retaining teachers for some content areas.

Fewer people in Colorado and across the nation are entering and completing educator preparation programs. Nationally, enrollment in educator prep programs declined by more than 30 percent in just four years. Colorado experienced a 24 percent decline in enrollment in educator prep programs and a 17 percent drop in those completing a program between 2010-11 and 2015-16.¹⁴⁹ Research points to several factors that are driving young adults away from entering teacher preparation programs, including low salaries relative to other careers with similar education requirements and heavy workloads, among others.¹⁵⁰

Colorado’s teacher shortage prompted the state legislature to pass a law calling for a strategic plan to address the issue. Recommendations included in the strategic plan, released in December 2017, include increasing teacher compensation and benefits, improving teacher retention through support for professional development and providing more time for experienced teachers to mentor those new to the profession.¹⁵¹

Enrollment and Completion of Colorado Educator Preparation Programs

Between 2010-11 and 2015-16, Colorado experienced a 24 percent decline in enrollment in educator preparation programs.

Four Fast Facts from Colorado's Teacher Shortage Report

Average Starting Teacher Salary, 2012-13

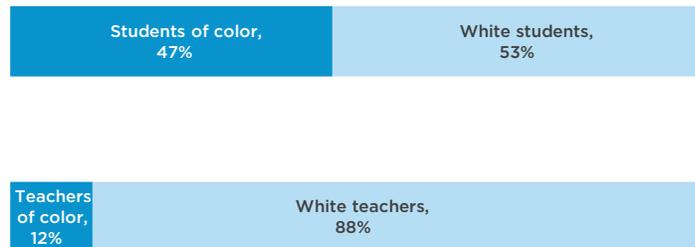

The average starting salary for a teacher in Colorado is 9 percent less than the national average.

Teacher shortages are especially acute in rural areas. More than 95 percent of rural districts have average teacher salaries that fall below their area's cost of living.

Many districts struggle to recruit and retain teachers of color, who offer important experiences and expertise for all students and particularly for students of color. Colorado has a diverse student population, yet nearly nine out of 10 Colorado teachers are white.

As enrollment in Colorado's teacher prep programs declines, the state must recruit half of its new teachers from other states.

Student Achievement

CSAP, TCAP, CMAS, NAEP—while these terms may look like alphabet soup, each has played a significant part in measuring Colorado students’ proficiency in key subjects during the past decade.

In the years since the first KIDS COUNT report, Colorado has implemented stronger, more rigorous academic standards for its students, along with an assessment system that is aligned to the new standards. It is designed to ensure that students in districts from Julesburg to Cortez are learning the same core concepts we all need to master in order to succeed in college, our careers and our lives. Although not the only way of measuring students’ abilities, standardized assessments provide a way to examine progress in reading, writing, math, and content area courses in order to understand how well schools are preparing them for college and the workforce. Because Colorado has used a variety of assessments during the past 25 years, the ability to examine long-term trends in student achievement is limited.

A Timeline of Colorado’s Statewide Assessments		2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018

	Science										█	
	Social Studies										█	

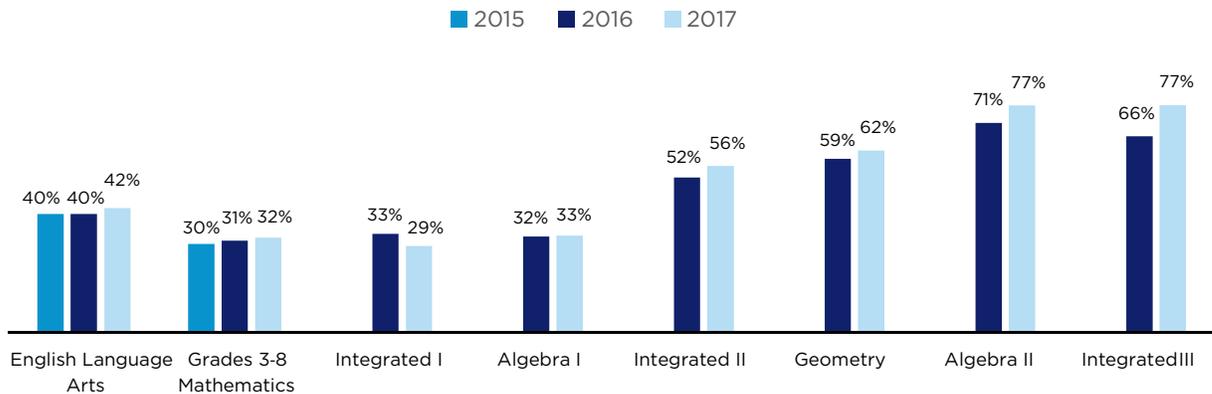

Overall Student Proficiency

In 2017, Colorado students took the Colorado Measures of Academic Success (CMAS) English Language Arts (ELA) and mathematics assessments for the third year.

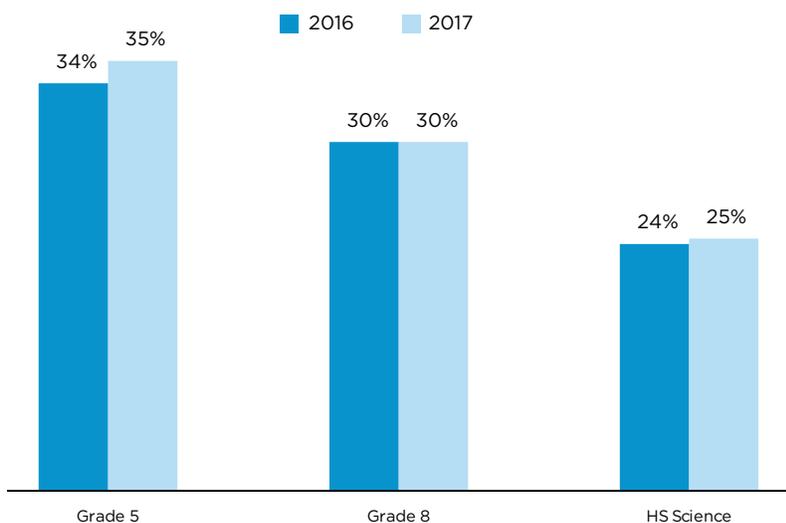

Compared to 2015, more students are meeting or exceeding expectations on ELA and mathematics assessments in grades three through eight, but most students are not yet performing on grade level in these areas.

In 2017, 42 percent of Colorado students in grades three through nine met or exceeded expectations in English Language Arts, up from 40 percent in 2015. Across all math assessments administered to students in grades three through nine, 33 percent of students demonstrated proficiency in 2017.¹⁵²

Colorado Students Meeting or Exceeding Expectations on CMAS Math and English Language Arts

Students Meeting or Exceeding Expectations on CMAS Science

On the CMAS Science assessment, fifth graders and students in high school saw a slight increase in the share of students earning proficient scores.¹⁵³ In 2017, 35 percent of fifth graders, 30 percent of eighth graders and 25 percent of high school students met or exceeded expectations in science.¹⁵⁴

¹⁵² Colorado Department of Education. 2017 CMAS Math and ELA District and School Overall Results. Math assessments include the Mathematics assessment administered to students in grades 3 through 8, as well as secondary math assessments (Algebra I, Geometry, Algebra II and Integrated Mathematics I, II and III). In 2017, students in grades 7 and 8 could take their grade-level mathematics assessment or a secondary math course. Students in grades 9 took one of the above secondary assessments.

¹⁵³ *Ibid.*

¹⁵⁴ *Ibid.*

Proficiency by Race/Ethnicity

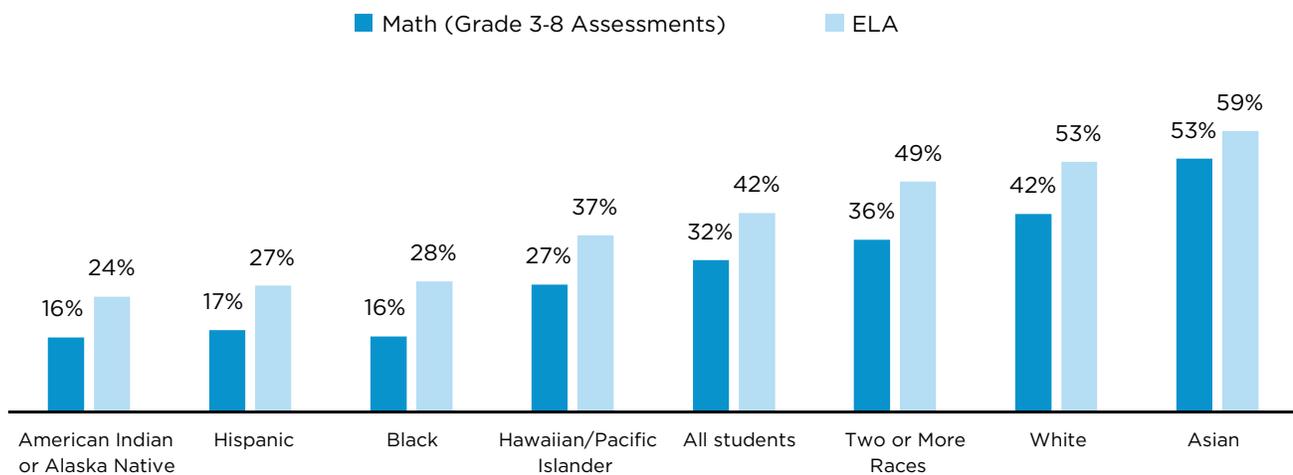

Gaps in academic performance between students of different races and ethnicities have persisted for many decades and indicate limited academic opportunities for many students of color in the United States.

Several factors contribute to the achievement gap between white students and students of color. Nationwide, black, Hispanic, and American Indian or Alaska Native students are more likely to be taught by first-year teachers.¹⁵⁵ Children of color are also more likely to live in poverty, due to long-standing barriers to economic opportunity. Concentrated poverty is often associated with a lack of academic resources.¹⁵⁶

In Colorado, data from the CMAS English Language Arts and Math assessments continue to show significant gaps between students of color and their white peers. When comparing Colorado kids to students across the country, performance data from the National Assessment of Educational Progress (NAEP) also indicate that Colorado is one of three states where the achievement gap between white and black students in fourth and eighth grades has significantly increased since 2003, despite the narrowing of this gap in many other states.¹⁵⁷

Although it is generally possible to see racial and ethnic achievement gaps at the state level, new data suppression policies implemented by the Colorado Department of Education have limited the ability to see racial disparities at the school district level (and in some cases, even at the county level). In some data sets, more than half of all disaggregated data have been masked.

Colorado Students Meeting or Exceeding Expectations in CMAS Math and English Language Arts by Race/Ethnicity, 2017

Colorado is one of only 14 states in which school districts serving the most students of color receive 5 percent (or \$549) less funding per pupil than districts serving the fewest students of color.

Proficiency by Family Income

Academic achievement gaps between students in low-income families and their classmates in higher-income families have also been researched for decades, indicating clear disparities in both opportunities and outcomes.¹⁵⁸

Differences in language skills between these two groups of children can emerge as early as 18 months, and analyzing these gaps can help educators and families address the areas where students in low-income families need the most support.^{159, 160}

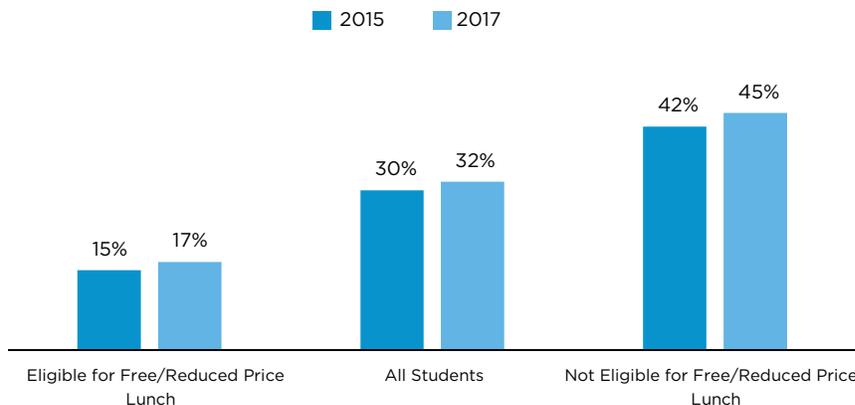

In 2017, the ELA proficiency gap between students in low-income families and their peers in higher-income families was 30 percentage points. Only 26 percent of students who were eligible for free or reduced price lunch—a proxy measure for low family income—scored proficient. In contrast, 56 percent of students in higher-income families met or exceeded expectations.¹⁶¹ While proficiency on the ELA assessment has increased across both groups of students in the past two years, the gap between them has actually widened by 1 point.

CMAS ELA Proficiency by Family Income

Among students who took the grade three through eight math assessments, just 17 percent of students in low-income families scored proficient. That compares to 45 percent of their classmates in more affluent families—a gap of 28 percentage points.¹⁶² Colorado’s income achievement gap in math proficiency has also slightly increased since 2015.

CMAS Math Proficiency by Family Income

¹⁶² *Ibid.*

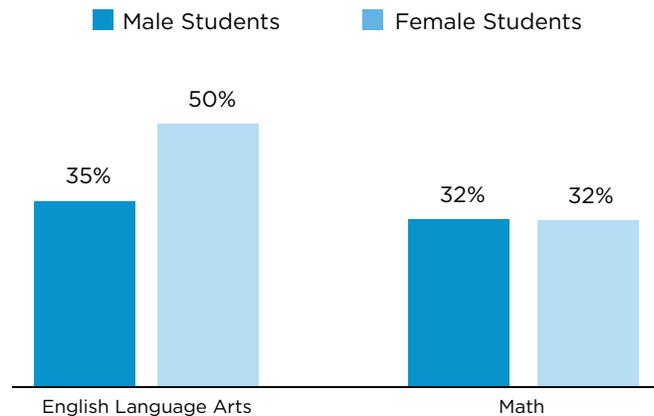

Proficiency by Gender

Historically, differences in achievement between male and female students in the United States have fallen along subject area lines: female students have generally scored higher on reading assessments while male students have performed better in math.¹⁶³ Research in this area has started to examine teacher-student interactions, the impact of teacher gender and social dynamics within classrooms to understand these gaps.¹⁶⁴

In Colorado, there was no gap in math proficiency between boys and girls in 2017, as 32 percent of each group met or exceeded expectations on the CMAS Math assessments for grades three through eight.¹⁶⁵

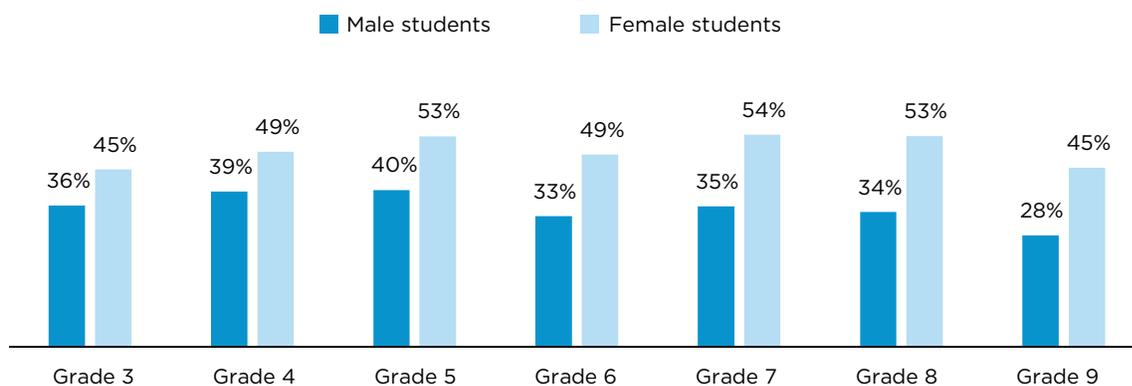

However, 50 percent of female students in grades three through nine met or exceeded expectations in English Language Arts, compared to 35 percent of male students.¹⁶⁶

2017 CMAS Proficiency by Gender

The gender achievement gap in English Language Arts widens in the older grades. In 2017, third-grade classrooms had the smallest gap between boys and girls (9 percentage points), while seventh- and eighth-grade classrooms had the largest gaps (19 percentage points).¹⁶⁷

Early Literacy

Children’s reading ability at the end of third grade can predict their likelihood of future academic success. Research has shown that in comparison to proficient readers, students who are not reading on grade level by the end of third grade are four times less likely to graduate from high school on time.¹⁶⁸ By fourth grade, children are at a critical turning point: in this year of instruction, students begin to apply their reading skills to learn concepts in other subjects. If students haven’t mastered fundamental literacy skills by fourth grade, literacy problems can limit academic progress in other classes.¹⁶⁹

Colorado 4th Grade Students Meeting or Exceeding Expectations in ELA, 2017

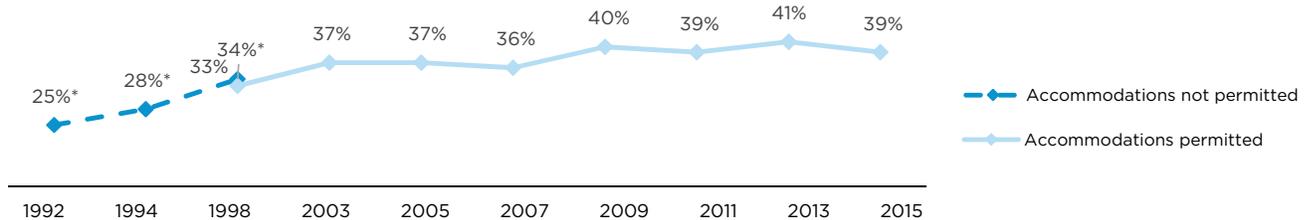

The Colorado Department of Education reports proficiency in English Language Arts, which combines reading and writing assessments. In 2017, only 44 percent of Colorado fourth graders met grade-level expectations on the CMAS ELA assessment, a slight improvement over 2015 when 42 percent met or exceeded expectations.¹⁷⁰

Gilpin County had the highest portion of fourth-grade students (64 percent) who met or exceeded expectations in English Language Arts, among counties for which data were reported.¹⁷¹ Costilla and Crowley counties had the lowest shares of fourth graders who met grade-level expectations, at 11 percent and 17 percent, respectively.¹⁷²

Fourth Grade Reading on the National Assessment of Educational Progress

Students in Colorado have taken the National Assessment of Educational Progress since 1992, offering a longer-term perspective on early literacy in our state. The first KIDS COUNT report highlighted that only one quarter of Colorado fourth graders were reading proficiently in 1992, according to NAEP, often referred to as the “Nation’s Report Card.” Significantly more fourth grade students in Colorado scored proficient or advanced as of 2015, but most of the progress our state has made in fourth grade reading occurred more than a decade ago. Since 2009, the percent of fourth-graders reading proficiently has stalled at around 40 percent.¹⁷³ Colorado students have outpaced the national average since 2003, but the gap is narrowing. In 2003, proficiency levels for Colorado fourth-graders were 6 percentage points higher than the national average; by 2015, the gap had narrowed to 3 percentage points.¹⁷⁴

Colorado 4th Graders Scoring Proficient or Advanced on the National Assessment of Educational Progress (NAEP)

*Prior to 1998, NAEP did not allow testing accommodations for students with disabilities and students who were English Language Learners. NAEP used a split-sample design in 1998 to introduce accommodations for these groups of students. For more information, visit nces.ed.gov/nationsreportcard/about/inclusion.aspx.

Graduation Rates

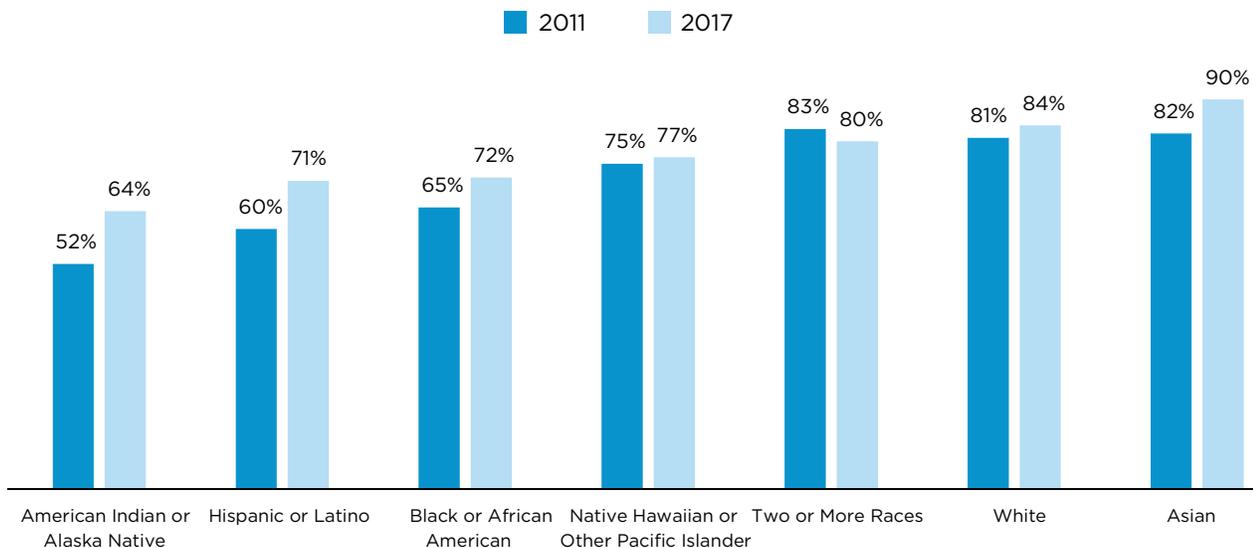

Colorado shifted to a new method of calculating graduation rates in 2010. Although the change in methodology prevents long-term comparisons, the new method provides a more accurate picture of how many Colorado students are graduating from high school on time. Data from 2010 forward show that Colorado's on-time graduation rate is improving, with students of color making some of the greatest gains.

In 2017, Colorado's high school graduation rate reached its highest level since 2010, when the Colorado Department of Education began using their current methodology. In the 2016-2017 school year, 79 percent of students in the state graduated on time.¹⁷⁵

Graduation rates for Hispanic students, American Indian or Alaska Native students, black students, and Asian students have increased dramatically in the past seven years.¹⁷⁶ However, Colorado's students of color still face more barriers to graduating high school on time than their white peers.

Graduation Rates by Race/Ethnicity, 2011 and 2017

Graduating from high school is an important stepping stone for Colorado's youth, positioning them to go to college and have more opportunities when they join the workforce. Obtaining a high school diploma is also linked to better health behaviors and outcomes, as well as increased life expectancy. In Colorado, median earnings for those without a high school diploma in 2016 were \$25,649, compared to \$31,515 for high school graduates.

¹⁷⁶ *Ibid.*

Dropout Rates

Dropout rates in Colorado can be reliably compared back to the 2005-06 school year, providing a slightly longer-term perspective on how many Colorado students do not complete high school.

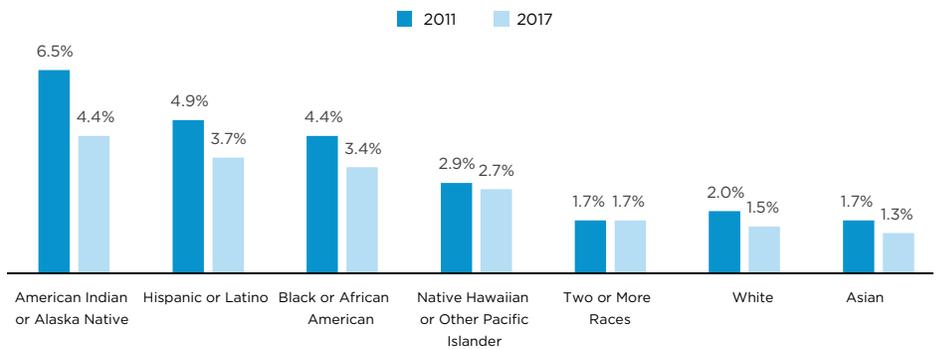

Dropping out of high school and failing to earn a diploma is linked with limited employment opportunities, lower income, and poor health.¹⁷⁷ Several factors are associated with dropping out, including a lack of engagement in school, struggling with reading proficiency, being held back a grade, and being chronically absent.¹⁷⁸ Dropping out is a process that can start when students are in elementary school, making it important to promote children’s engagement in school throughout their academic careers.¹⁷⁹

The dropout rate captures students in grades seven through 12 who leave school during the year and fail to enroll at another school or program. Colorado’s dropout rate fell by nearly half between 2006 and 2017.¹⁸⁰

Students of color are more likely to drop out of school due to several factors. These include a higher likelihood of living in poverty and an increased risk of experiencing punitive academic and behavioral interventions, including suspensions and expulsions, often as a result of adults’ implicit bias.¹⁸¹ Like graduation rates, however, dropout rates have also fallen for almost all racial and ethnic groups in the state.¹⁸²

Remediation Rates

Graduating from high school opens doors to opportunity for Colorado’s youth, but our state has work to do to ensure high school graduates are equipped with the skills they need to be successful in college or in their careers. Among Colorado students who graduated from a public high school in 2015 and went on to attend a public, in-state college or university, more than one in three (36 percent) required remediation in at least one subject.¹⁸³

To understand how Colorado public schools are preparing students for college in core subject areas, the Colorado Department of Higher Education (CDHE) collects data on students who require remedial or developmental education at in-state colleges and universities. While these percentages do not reflect the outcomes of all Colorado students who go on to college, they reflect the majority of students (76 percent from the class of 2015), as most students go on to in-state institutions.¹⁸⁴

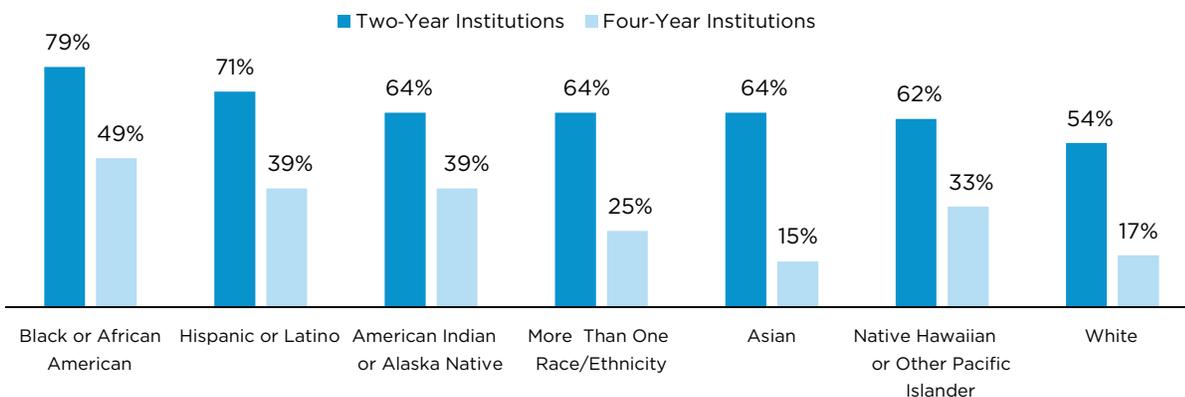

Colorado Students Placed into Developmental Education, 2009-2015

The need for remedial education comes at a significant cost to Colorado: the Colorado Department of Higher Education estimated that the cost of remedial education—to Colorado students and to the state—totaled \$29.6 million in 2015-2016.

Among the class of 2015, 63 percent of students who attended two-year institutions required remediation, while 22 percent of students who enrolled at four-year institutions needed remediation.¹⁸⁵ Students of color and students from low-income families faced the most barriers to college readiness.¹⁸⁶

Educational Attainment

The first *KIDS COUNT in Colorado!* report highlighted the need for our state’s education system to adequately prepare its students for “an increasingly specialized economy” and noted that high-paying jobs requiring little formal education were becoming fewer and farther between. Our nation’s economy and employment market have continued to undergo significant changes since the first report was released—and recent statistics show that postsecondary education and training have become even more important for young adults.

A 2016 analysis from the Georgetown University Center on Education and the Workforce found that of the 11.6 million jobs created after the Great Recession, 11.5 million—more than 99 percent—went to workers with at least some postsecondary education.¹⁸⁷ And as of 2016, jobs that typically require postsecondary education made up 37 percent of all employment, according to the Bureau of Labor Statistics.¹⁸⁸ Projections show postsecondary education and training becoming increasingly critical in the decades to come.¹⁸⁹

Adults Ages 25 and Older with at least a Bachelor's Degree, 2012-2016

Educational attainment among Colorado adults has historically been higher than the national average. However, Colorado also has an “attainment gap” between white residents and residents of color that is more than twice as large as the national average.¹⁹⁰ As we turn our focus toward the next 25 years, it is critical that Colorado remove barriers to postsecondary education for all young people, and particularly for children of color. Investing in educational opportunities for Colorado kids will help ensure a strong and vibrant economy for generations to come.

COUNTY DATA DEFINITIONS

The Colorado Children's Campaign relies on data from federal, state and local agencies. These sources are the final authority relating to the quality of any data. Please note that all vital statistics are reported by place of residence, not place of birth or death.

POPULATION

Total Population (number)

Population estimates from the Colorado State Demography Office, Colorado Department of Local Affairs. Estimates retrieved on November 8, 2017.

Child Population (Under 18) (number)

Number of children less than 18 years of age from the Colorado State Demography Office, Colorado Department of Local Affairs. Estimates retrieved on November 8, 2017.

Children as a Percentage of Total Population (percent)

Number of children less than 18 years of age from the Colorado State Demography Office, Colorado Department of Local Affairs. Calculations performed by the Colorado Children's Campaign. This statistic shows the proportion of a county's population that is under 18 years of age.

Young Child Population (Under 5) (number)

Number of children less than 5 years of age from the Colorado State Demography Office, Colorado Department of Local Affairs. Estimates retrieved on November 8, 2017.

School-Aged Population (Ages 5-17) (number)

Number of children ages 5 through 17 from the Colorado State Demography Office, Colorado Department of Local Affairs. Estimates retrieved on November 8, 2017.

VULNERABLE FAMILIES

Births to Single Women (percent)

Percent of live births occurring to unmarried women provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three births to single women in the county.

Births to Women without a High School Diploma or GED (percent)

Percent of live births occurring to women without a high school diploma or GED provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three births to women with less than 12 years of education in the county.

Teen Births (rate per 1,000 female teens ages 15-19)

Number of live births to women ages 15 through 19 per 1,000 women of that age (age-specific fertility rate) provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three teen births in the county.

Three Risk Factor Births (percent)

Percent of live births occurring to unmarried women under 25 years of age with less than 12 years of education by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three births in this category in the county.

Out-of-Home Placements (rate per 1,000 children under 18)

Number of children removed from their homes by the Department of Human Services per 1,000 children under age 18 provided by the Division of Child Welfare, Colorado Department of Human Services. Out-of-home placements include family foster care, specialized group homes, residential child care facilities, independent living situations, foster care with relatives, residential treatment centers, and both emergency and non-emergency placements or shelters.

COUNTY DATA DEFINITIONS

FAMILY ECONOMICS AND SUPPORTS

Children Qualifying for Free or Reduced-Price Lunch (percent)

Percent of children in public school grades PK-12 who qualified for free or reduced-price school lunches in the fall of 2017. Data provided by the Colorado Department of Education. Public school children qualify for free lunches if their family's income falls below 130 percent of the federal poverty level (FPL). Public school children qualify for reduced-price lunches if their family's income is between 130 percent and 185 percent of the FPL.

Median Household Income (dollars)

Median household income in 2016 from the U.S. Census Bureau Small Area Income and Poverty Estimates (SAIPE).

Children (Under 18) in Poverty (percent)

Percent of children under age 18 living in families with incomes at or below the federal poverty level in 2016, from the U.S. Census Bureau Small Area Income and Poverty Estimates (SAIPE).

School-Aged Children (Ages 5-17) in Poverty (percent)

Percent of children ages 5 through 17 living in families with incomes at or below the federal poverty level in 2016, from the U.S. Census Bureau Small Area Income and Poverty Estimates (SAIPE).

Children Receiving TANF Basic Cash Assistance Payments (percent)

Percent of children receiving Basic Cash Assistance payments as part of the Temporary Assistance for Needy Families (TANF) program during the 2017 calendar year. Caseload data by individual children is provided by the Colorado Department of Human Services. Calculations performed by the Colorado Children's Campaign.

Children Under 5 Receiving WIC Program Vouchers (percent)

Percent of children under age 5 (until their fifth birthday) served by the Special Supplemental Nutrition Program for Women, Infants, and Children (WIC) during the 2017 calendar year. Number reflects unduplicated count of WIC child participants. Data provided by the Office of Information Technology. Calculations performed by the Colorado Children's Campaign. Note: Some local WIC programs provide services to children from other counties. Gilpin, Hinsdale, Mineral and San Juan counties did not have a WIC program in 2017 and children in these counties were served by neighboring counties.

COUNTY DATA DEFINITIONS

CHILD AND MATERNAL HEALTH

Live Births (number)

Total number of live births provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three births in the county.

Low Weight Births (percent)

Percent of babies born weighing 5.5 pounds or less (less than 2500 grams) provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three low weight births in the county.

Early Prenatal Care (percent)

Percent of live births in which prenatal care was initiated in the first trimester of pregnancy with known start of prenatal care provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three births to mothers receiving early prenatal care in the county.

Births to Women who Smoked During Pregnancy (percent)

Percent of live births in which women reported smoking during pregnancy on their infant's birth certificate provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Please note that these data are most likely underreported on birth certificates across the state due to mothers' knowledge of the risks of smoking during pregnancy. Low number of events (LNE) indicates fewer than three births to women who smoked during pregnancy in the county.

Child Abuse and Neglect (rate per 1,000 children under 18)

Incidence of maltreatment of children under 18 (including physical abuse, sexual abuse, emotional abuse and/or neglect) provided by the Division of Child Welfare, Colorado Department of Human Services. The value is the number of unique substantiated cases per 1,000 children.

COUNTY DATA DEFINITIONS

Infant Mortality (rate per 1,000 live births)

Number of infant deaths in the first year of life per 1,000 live births provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. Low number of events (LNE) indicates fewer than three infant deaths in the county.

Child (Ages 1-14) Deaths (rate per 100,000 children ages 1-14)

Number of deaths per 100,000 children ages 1 through 14 provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. The data include deaths from natural causes (such as illness or congenital defects) and injury (including motor vehicle deaths, homicides and suicides). Low number of events (LNE) indicates fewer than three child deaths in the county.

Teen (Ages 15-19) Deaths (rate per 100,000 teens ages 15-19)

Number of deaths per 100,000 teens ages 15 through 19 provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. The data include deaths from natural causes (such as illness or congenital defects) and injury (including motor vehicle deaths, homicides and suicides). Low number of events (LNE) indicates fewer than three teen deaths in the county.

Child (Ages 1-14) Deaths Due to Injury (rate per 100,000 children ages 1-14)

Number of deaths due to intentional and unintentional injuries per 100,000 children ages 1 through 14 provided by the Vital Statistics Program, Colorado Department of Public Health and Environment. The data include deaths due to homicide, suicide and accidents. Low number of events (LNE) indicates fewer than three child deaths due to injury in the county.

Teen (Ages 15-19) Deaths Due to Injury (rate per 100,000 teens ages 15-19)

Number of deaths due to intentional and unintentional injuries per 100,000 teens ages 15 through 19 provided by the Vital Statistics Program, Colorado Department of Health and Environment. The data include deaths due to homicide, suicide and accidents. Low number of events (LNE) indicates fewer than three teen deaths due to injury in the county.

Children (Ages 0-18) Enrolled in CHP+ (percent)

Estimated percent of children ages 0 through 18 enrolled in the Child Health Plan Plus (CHP+) during fiscal year 2016-2017. Data provided by the Colorado Department of Health Care Policy and Financing. Low number of events (LNE) indicates fewer than 30 clients in the county. Calculations performed by the Colorado Children's Campaign. As of 2017, children ages 0 through 18 whose family's modified adjusted gross income (MAGI) is below 260 percent of FPL but above the Medicaid income eligibility cutoff are eligible for CHP+.

Important note: The numbers used to calculate this percentage include a unique count of all clients ages 0 through 18 who were served at any point during FY16-17. The CHP+ numbers reported here do not match official budget numbers. Official budget numbers reflect an average monthly caseload over the course of a year and are lower than the numbers reported here.

Children (Ages 0-18) Enrolled in Medicaid (percent)

Estimated percent of children ages 0 through 18 enrolled in Medicaid during fiscal year 2016-2017. Data provided by the Colorado Department of Health Care Policy and Financing. Low number of events (LNE) indicates fewer than 30 clients in the county. Calculations performed by the Colorado Children's Campaign. As of 2017, children whose family's modified adjusted gross income (MAGI) is below 142 percent of the federal poverty level are eligible for Medicaid.

Important note: The numbers used to calculate this percentage include a unique count of all clients ages 0 through 18 who were served at any point during FY16-17. The Medicaid numbers reported here do not match official budget numbers. Official budget numbers reflect an average monthly caseload over the course of a year and are lower than the numbers reported here.

COUNTY DATA DEFINITIONS

Uninsured Children (Ages 0-18) (percent)

Uninsured rates based on Colorado Health Institute (CHI) analyses of data from the 2016 American Community Survey (ACS). A child was counted as uninsured if his or her parent reported that the child did not have any form of health insurance at the time at which the ACS questionnaire was administered. CHI applied a method developed by the University of Missouri to apportion ACS geographic strata to Colorado counties in order to yield county-level estimates. Due to several counties being part of the same ACS stratum, uninsured rates will be similar for several rural counties.

Children Eligible for Medicaid or CHP+ But Not Enrolled (Ages 0-18) (percent)

EBNE estimates provided by the Colorado Health Institute. Estimates of the eligible but uninsured (referred to as the eligible but not enrolled) population come from the U.S. Census Bureau's 2016 American Community Survey. The data are weighted to represent the state population as well as geographic sub-regions within Colorado. CHI applies a method developed by the University of Missouri to apportion the ACS regions and yield county-level estimates. A child was counted as uninsured if his or her parent reported that the child did not have any form of health insurance when the ACS questionnaire was administered. Eligibility is based on family income as a percentage of the federal poverty level (FPL). CHI, in order to calculate the ratio of annual family income to federal poverty guidelines, developed a method to identify and calculate nuclear family income within households in which multiple related families reside. This approach more closely approximates eligibility determination guidelines. These analyses are limited to Coloradans for whom ACS income data were collected. Income and poverty data are not available for foster children or for people living in prisons, nursing homes, mental hospitals, college dormitories or military quarters. Eligibility for Medicaid or CHP+ is based on age, income and residency status. **Note: 2016 data do not include children eligible for subsidies and therefore cannot be compared to data from prior years.**

COUNTY DATA DEFINITIONS

EDUCATION

PK-12 Pupil Enrollment (number)

Number of children enrolled in public schools in the fall of 2016 provided by the Colorado Department of Education.

Kindergartners in a Full-Day Program (percent)

Number of kindergartners enrolled in a full-day kindergarten program in the fall of 2016 divided by the number of students enrolled in all public kindergarten programs, provided by the Colorado Department of Education. Calculations performed by the Colorado Children's Campaign.

English Language Learners (percent)

Number of students classified as English Language Learners in the fall of 2016 divided by total enrollment, provided by the Colorado Department of Education. Calculations performed by the Colorado Children's Campaign.

High School Graduation Rate (percent)

Percentage of students who graduated from high school in 2016, four years after entering ninth grade. Data provided by the Colorado Department of Education. Calculations performed by the Colorado Children's Campaign.

4th Grade Students Meeting or Exceeding Expectations in English Language Arts (percent)

Percent of 4th grade students who scored proficient in English Language Arts on the 2017 Colorado Measures of Academic Success (CMAS) assessment provided by the Colorado Department of Education (CDE). CDE does not report CMAS data if the number of students taking the test is fewer than 16, if the cell size for a given proficiency level is below 3, or if the data meet the department's guidelines for complementary suppression; low number of events (LNE) indicates data that has been suppressed for one of these reasons. County data are based on scores from the districts that comprise each county.

Students Meeting or Exceeding Expectations on CMAS Math (percent)

Percent of all students who scored proficient in Math on the 2017 Colorado Measures of Academic Success (CMAS) assessments for grades 3 through 9 provided by the Colorado Department of Education (CDE). CDE does not report CMAS data if the number of students taking the test is fewer than 16, if the cell size for a given proficiency level is below 3, or if the data meet the department's guidelines for complementary suppression; low number of events (LNE) indicates data that has been suppressed for one of these reasons. County data are based on scores from the districts that comprise each county.

Students Meeting or Exceeding Expectations on CMAS English Language Arts (percent)

Percent of all students who scored proficient in English Language Arts on the 2017 Colorado Measures of Academic Success (CMAS) assessments for grades 3 through 9 provided by the Colorado Department of Education (CDE). CDE does not report CMAS data if the number of students taking the test is fewer than 16, if the cell size for a given proficiency level is below 3, or if the data meet the department's guidelines for complementary suppression; low number of events (LNE) indicates data that has been suppressed for one of these reasons. County data are based on scores from the districts that comprise each county.

Students Meeting or Exceeding Expectations on CMAS Science (percent)

Percent of all students who scored proficient in Science on the 2017 Colorado Measures of Academic Success (CMAS) assessments provided by the Colorado Department of Education (CDE). CDE does not report CMAS data if the number of students taking the test is fewer than 16, if the cell size for a given proficiency level is below 3, or if the data meet the department's guidelines for complementary suppression; low number of events (LNE) indicates data that has been suppressed for one of these reasons. County data are based on scores from the districts that comprise each county.

ACKNOWLEDGEMENTS

The Colorado Children's Campaign would like to thank the following people and organizations that helped provide data and expertise for the *2018 KIDS COUNT in Colorado!* report, and that dedicate themselves to the well-being of Colorado's children every day. We sincerely thank you for your generous contribution of time, data and advice.
